

The Predictive Value of Nomogram Model Based on Neutrophil-to-Lymphocyte Ratio (NLR) and Prothrombin Time-International Normalized Ratio (PT-INR)-to-Albumin Ratio (PTAR) for Early Bacterial Intra-Abdominal Infection After Orthotopic Liver Transplantation [Corrigendum]

Peng HB, Liu Y, Hou F, et al. *J Inflamm Res.* 2026;19:571498. <https://doi.org/10.2147/JIR.S571498>

On Page 9, Table 5, the average levels of FK506 within 30 days [median (IQR), days, ng/mL] for the Non-Infection Group (n=211) should have been 8.78(6.78,11.85) instead of 5.60(3.18,7.60), for the Infection Group (n=50) should have been 8.60(6.98,10.76) instead of 5.20(3.70, 7.10). The $t/Z/\chi^2$ value for the same row should be -0.125 instead of -0.274 and the P value should be 0.90 instead of 0.78.

Following internal review, the authors found that incorrect values were transcribed to Table 5. The authors apologize for this error.
