Supplementary Material

Supplementary Material 1: Method

Data sources and gene sets associated with PCD

The regulatory genes associated with 14 distinct PCD patterns were collected from a range of sources, including the GeneCards database[1], the Kyoto Encyclopedia of Genes and Genomes (KEGG) database[2], the Molecular Signatures Database (MSigDB)[3], and various review articles[4–7]. An exhaustive set of 1,321 unique genes associated with 14 different PCD pathways has been identified. Specifically, 580 genes involved in apoptosis were identified, along with 52 in pyroptosis, 88 in ferroptosis, 368 in autophagy, 101 in necroptosis, 14 in cuproptosis, 24 in disulfidptosis, 9 in parthanatos, 15 in entotic cell death, 8 in netotic cell death, 220 in lysosome-dependent cell death, 7 in alkaliptosis, 6 in oxeiptosis, and 25 in zinc-dependent cell death. Detailed gene lists are provided in Table S3.

Sensitivity analysis

SNPs associated with QTLs ($P < 5.0 \times 10^{-8}$) were selected, and LD clumping was performed with an LD $r^2 < 0.1$ within 10,000 kb regions. IVs with an F statistic < 10 [$F = (beta/se)^2$] were deleted to minimize bias caused by weak instrumental factors. Additionally, to minimize the potential influence of reverse causation, Steiger filtering was utilized to identify and exclude SNPs that accounted for more variance in the outcome than in the exposure[8]. The association between each SNP and the outcome was calculated using the Wald ratio method. When multiple SNPs were available, their effects were aggregated using the inverse-variance weighting (IVW) method. We

utilized Cochran's Q test to evaluate effect heterogeneity. For the IVW method, a fixed-effects model was applied to combine the results when there was no heterogeneity, whereas a random-effects model was employed when heterogeneity was detected. Additionally, when three or more genetic instruments were available, the MR-Egger intercept test was used to assess directional horizontal pleiotropy, with a *P*-value < 0.05 indicating the presence of pleiotropy, rendering the association invalid.

Transcriptome-wide association studies analysis and gene analysis

Cross-tissue gene expression weights constructed using sparse canonical correlation analysis (sCCA) from the GTEx were utilized, enhancing statistical power by integrating signals across multiple tissues and offering an advantage over single-tissue TWAS[9]. Subsequently, the sCCA-TWAS test results were combined using the aggregate Cauchy association test (ACAT). Multi-marker analysis of genomic annotation (MAGMA, version 1.08) was applied to perform gene analysis of GWAS data, default parameters were used to aggregate SNP-level association statistics into gene scores, which quantified the degree of association between each gene and the phenotype.

Molecular docking

The drug candidates were evaluated by analysing binding energy and interaction patterns with their target proteins. Protein structure data were retrieved from the Protein Data Bank (PDB,

http://www.rcsb.org/) and Alphafold[10], with AlphaFold structures accessed through the UniProt database (https://www.uniprot.org/). Structure data for the drugs were sourced from the PubChem Compound database (https://pubchem.ncbi.nlm.nih.gov/). Prior to docking, all water molecules and unnecessary ligands were removed from the protein and ligand files, and polar hydrogen atoms were added. Subsequently, various conformations and their binding energy scores between the proteins encoded by the identified genes and the top 3 significant drugs were generated through molecular docking using AutoDock Vina 1.2.0[11]. Finally, PyMol 3.0.3 was used to visualize the docking results for compounds and proteins.

Supplementary Material 2: Results

Asthma

For overall asthma, the methylation level of cg14652403 (Beta = 0.822) was positively correlated with IDUA expression level, while increased IDUA expression level (Beta = 1.109) was linked to higher IDUA protein abundance, thereby increasing the disease risk (Table S16-S17). For non-allergic asthma, the methylation level of cg21080034 (Beta = -0.543) was inversely correlated with HSPA1B expression level, while an increase in HSPA1B expression level (Beta = -0.108) was linked to decreased HSPA1B protein abundance, which in turn reduced the disease risk (Table S16-S17).

COPD

For overall COPD, the methylation level of cg00192773 (Beta = -0.545) was inversely correlated with MAPK3 expression level, while an increase in MAPK3 expression level (Beta = 0.315) was linked to reduced MAPK3 protein abundance, ultimately lowering disease risk (Table S16-S17). With regard to COPD in never-smokers, genetically predicted methylation level of cg23731805 (Beta = -0.801) was inversely associated with ERBB3 expression level, whereas the methylation level of cg17843101 (Beta = 0.483) was positively correlated with ERBB3 expression level. Elevated ERBB3 expression level (Beta = 0.397) was associated with increased ERBB3 protein abundance, which was inversely linked to disease risk. However, no significant relationships were identified between cg10869879, cg00907267, and ERBB3 expression level (Table S16-S17).

Lung function parameters

In the context to FEV1, genetically predicted methylation levels of cg07935886 (Beta = 0.100), cg01074584 (Beta = 0.103), cg00000321 (Beta = 0.121), and cg14824386 (Beta = 0.109) were positively associated with SFRP1 expression level, while elevated SFRP1 expression level (Beta = 0.397) was linked to increased SFRP1 protein abundance, subsequently associated with a reduction in FEV1. However, no significant relationships were observed between cg03133371, cg10406295, cg14904908, and SFRP1 expression level (Table S16-S17). For FEV1/FVC, genetically predicted elevated methylation level of cg15321288 (Beta = 0.517) was linked to increased FGFR1 expression level, whereas elevated FGFR1 expression level (Beta = 0.244) was associated with higher FGFR1 protein abundance. However, no significant relationships were identified between cg12614213, cg24828864, and FGFR1 expression level (Table S16-S17).

Table S2: STROBE-MR checklist of recommended items to address in reports of Mendelian randomization studies

Item No.	Section		Checklist item	Page No.	Relevant text from manuscript
1	**TITLE and ABSTRACT**		Indicate Mendelian randomization (MR) as the study's design in the title and/or the abstract if that is a main purpose of the study	1-2	Abstract
	INTRODUCTION				
2	**Background**		Explain the scientific background and rationale for the reported study. What is the exposure? Is a potential causal relationship between exposure and outcome plausible? Justify why MR is a helpful method to address the study question	2-4	Lines: 47-83
3	**Objectives**		State specific objectives clearly, including pre-specified causal hypotheses (if any). State that MR is a method that, under specific assumptions, intends to estimate causal effects	3-4	Lines: 71-83
	METHODS				
4	**Study design and data sources**		Present key elements of the study design early in the article. Consider including a table listing sources of data for all phases of the study. For each data source contributing to the analysis, describe the following:		
		a)	Setting: Describe the study design and the underlying population, if possible. Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection, when available.	4	Lines: 85-94, Figure 1
		b)	Participants: Give the eligibility criteria, and the sources and methods of selection of participants. Report the sample size, and whether any power or sample size calculations were carried out prior to the main analysis	4-5	Lines: 101-127, Table S1
		c)	Describe measurement, quality control and selection of genetic variants	5-6	Lines: 132-144
		d)	For each exposure, outcome, and other relevant variables, describe methods of assessment and diagnostic criteria for diseases	5	Lines: 112-127
		e)	Provide details of ethics committee approval and participant informed consent, if relevant		NA
5	**Assumptions**		Explicitly state the three core IV assumptions for the main analysis (relevance, independence and exclusion restriction) as well assumptions for any additional or sensitivity analysis	4, 6	Lines: 93-94, 146-149
6	**Statistical methods: main analysis**		Describe statistical methods and statistics used		

		a) Describe how quantitative variables were handled in the analyses (i.e., scale, units, model)	5-6	Lines: 132-144
		b) Describe how genetic variants were handled in the analyses and, if applicable, how their weights were selected		
		c) Describe the MR estimator (e.g. two-stage least squares, Wald ratio) and related statistics. Detail the included covariates and, in case of two-sample MR, whether the same covariate set was used for adjustment in the two samples		
		d) Explain how missing data were addressed		
		e) If applicable, indicate how multiple testing was addressed		
7	**Assessment of assumptions**	Describe any methods or prior knowledge used to assess the assumptions or justify their validity	6	Lines: 145-157
8	**Sensitivity analyses and additional analyses**	Describe any sensitivity analyses or additional analyses performed (e.g. comparison of effect estimates from different approaches, independent replication, bias analytic techniques, validation of instruments, simulations)	6-8	Figure 1; Lines: 145-157, 174-192
9	**Software and pre-registration**			
		a) Name statistical software and package(s), including version and settings used	5-9	Lines: 131-157, 174-220
		b) State whether the study protocol and details were pre-registered (as well as when and where)		NA
	RESULTS			
10	**Descriptive data**			
		a) Report the numbers of individuals at each stage of included studies and reasons for exclusion. Consider use of a flow diagram	4-6	Lines: 97-144; Figure 1; Table S1
		b) Report summary statistics for phenotypic exposure(s), outcome(s), and other relevant variables (e.g. means, SDs, proportions)	4-5	Lines: 97-130, Table S1
		c) If the data sources include meta-analyses of previous studies, provide the assessments of heterogeneity across these studies		NA
		d) For two-sample MR: i. Provide justification of the similarity of the genetic variant-exposure associations between the exposure and outcome samples ii. Provide information on the number of individuals who overlap between the exposure and outcome studies	6	Lines: 145-149

11	**Main results**			
		a) Report the associations between genetic variant and exposure, and between genetic variant and outcome, preferably on an interpretable scale	10-12	Lines: 231-283
		b) Report MR estimates of the relationship between exposure and outcome, and the measures of uncertainty from the MR analysis, on an interpretable scale, such as odds ratio or relative risk per SD difference	10-12	Lines: 231-283, Table S4-S12, S18-S26, S30-S38, Figure 2-6
		c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period		NA
		d) Consider plots to visualize results (e.g. forest plot, scatterplot of associations between genetic variants and outcome versus between genetic variants and exposure)		Figure 2-6
12	**Assessment of assumptions**			
		a) Report the assessment of the validity of the assumptions		Table S4-12, 18-26, 30-38
		b) Report any additional statistics (e.g., assessments of heterogeneity across genetic variants, such as I^2, Q statistic or E-value)		Table S5-S6, S8-S9, S11-S12, S19-S20, S22-S23, S25-S26, S31-S32, S34-S35, S37-S41
13	**Sensitivity analyses and additional analyses**			
		a) Report any sensitivity analyses to assess the robustness of the main results to violations of the assumptions	10-12	Lines: 231-304, Table S5-S6, S8-S9, S11-S15, S19-S20, S22-S23, S25-S29, S31-S32, S34-S35, S37-S41
		b) Report results from other sensitivity analyses or additional analyses		
		c) Report any assessment of direction of causal relationship (e.g., bidirectional MR)		
		d) When relevant, report and compare with estimates from non-MR analyses		NA
		e) Consider additional plots to visualize results (e.g., leave-one-out analyses)		NA
	DISCUSSION			
14	**Key results**	Summarize key results with reference to study objectives	14	Lines: 341-353
15	**Limitations**	Discuss limitations of the study, taking into account the validity of the IV assumptions, other sources of potential bias, and imprecision. Discuss both direction and magnitude of any potential bias and any efforts to address them	17-18	Lines: 435-447
16	**Interpretation**			

		a) Meaning: Give a cautious overall interpretation of results in the context of their limitations and in comparison with other studies	15-17	Lines: 354-427
		b) Mechanism: Discuss underlying biological mechanisms that could drive a potential causal relationship between the investigated exposure and the outcome, and whether the gene-environment equivalence assumption is reasonable. Use causal language carefully, clarifying that IV estimates may provide causal effects only under certain assumptions		
		c) Clinical relevance: Discuss whether the results have clinical or public policy relevance, and to what extent they inform effect sizes of possible interventions		
17	**Generalizability**	Discuss the generalizability of the study results (a) to other populations, (b) across other exposure periods/timings, and (c) across other levels of exposure	17	Lines: 436-438
	OTHER INFORMATION			
18	**Funding**	Describe sources of funding and the role of funders in the present study and, if applicable, sources of funding for the databases and original study or studies on which the present study is based	19	Lines: 474-175
19	**Data and data sharing**	Provide the data used to perform all analyses or report where and how the data can be accessed, and reference these sources in the article. Provide the statistical code needed to reproduce the results in the article, or report whether the code is publicly accessible and if so, where	19	Lines: 476-478
20	**Conflicts of Interest**	All authors should declare all potential conflicts of interest	18	Lines: 458-459

* Only associations meeting the criteria of P < 0.05, P-HEIDI > 0.01, and passing sensitivity analysis are presented

PCD, programmed cell death; SMR, Summary data-level Mendelian randomization; OR, odds ratio; CI, confidence interval; FDR, false dicovery rate; HEIDI, heterogeneity in dependent instruments; SNP, single nucleotide polymorphsim;

Table S5. Sensitivity analysis of associations between PCD-related gene methylation and asthma*
