Selecting the preferred model for the four health domains in the summary-score strategy based on

- Profile plots (from Latent GOLD): The Profile Plot is constructed from the conditional probabilities for the nominal variables and means for the other indicators as displayed in the columns of the Profile table ('profile in numbers'). The quantities associated with the clusters are plotted and connected to form a line graph.
 - For the scale types ordinal and continuous, prior to plotting the class-specific means, they are re-scaled to always lie within the 0-1 range. Scaling of these "0-1 Means" is accomplished by subtracting the lowest observed value from the class-specific means and dividing the results by the range, which is simply the difference between the highest and the lowest observed value. The advantage of such scaling is that these numbers can be depicted on the same scale as the class-specific probabilities for nominal variables
 - For nominal variables containing more than 2 categories, all categories are displayed simultaneously.
 - For dichotomous variables specified as nominal, by default only the last category is displayed.
 - A separate line is displayed for each cluster
 - Lowest cluster size is noted and consistency of BIC (Bayesian Information Criterion) for selected models
 - Brief descriptions of subgroups are included for selected models
 - Used synonyms for subgroup: domain profile (DP), cluster, class
- Profiles in numbers (conditional probabilities from Latent GOLD)
- Loadings (from Latent GOLD)

Psychology domain – summary-score strategy

Profile-plots: Results with 3 to 10 domain profiles based on the following variables:

Okon0	On an average day, what are your possibilities of handling or controlling your pain? (0= no possibility, 10= complete control)
Okom0	How big is the chance of you being recovered within 3 months? (0=high chance, 1= Little or no chance)
Oens0	To what extent do you feel lonely? (0=not lonely, 1=little to very lonely)
Obeh0	How well do you agree: Treatment is crucial to reduce my pain? (0=fully agree, 10=fully disagree)
SBT_score	Sum-score' representing all questions related to the STarT Back Tool (9 questions) (1=high risk)
Fabqpa	Sum-score representing the following items from the Fear Advoidence Beliefs Questionnaire: 2,3,4,5 (0-24) FABQ2: Physical activity makes my pain worse (0=disagree, 3 = don't know, 6=agree) FABQ3: Physical activity might harm my back (0=disagree, 3= don't know, 6=agree) FABQ4: I should not do physical activities which (might) make my pain worse (0=disagree, 3= don't know, 6=agree) FABQ5: I cannot do physical activities which (might) make my pain worse (0=disagree, 3=don't know, 6=agree)
Fabq140	I cannot do my normal work till my pain is treated (0=disagree, 6 = agree)
Mdi_tot	Sum-score representing the Major Depression Inventory (10 questions)

AMN's suggestion on final model: 6 domain profiles (clusters)

Cluster 1: Believe in recovery, not lonely, treatment IS crucial

Cluster 2: Slightly displeased, treatment IS NOT crucial

Cluster 3: The positives – control of pain, can work despite pain and not depressed

Cluster 4: Slightly displeased, treatment IS fairly crucial

Cluster 5: The lonely and depressed patients

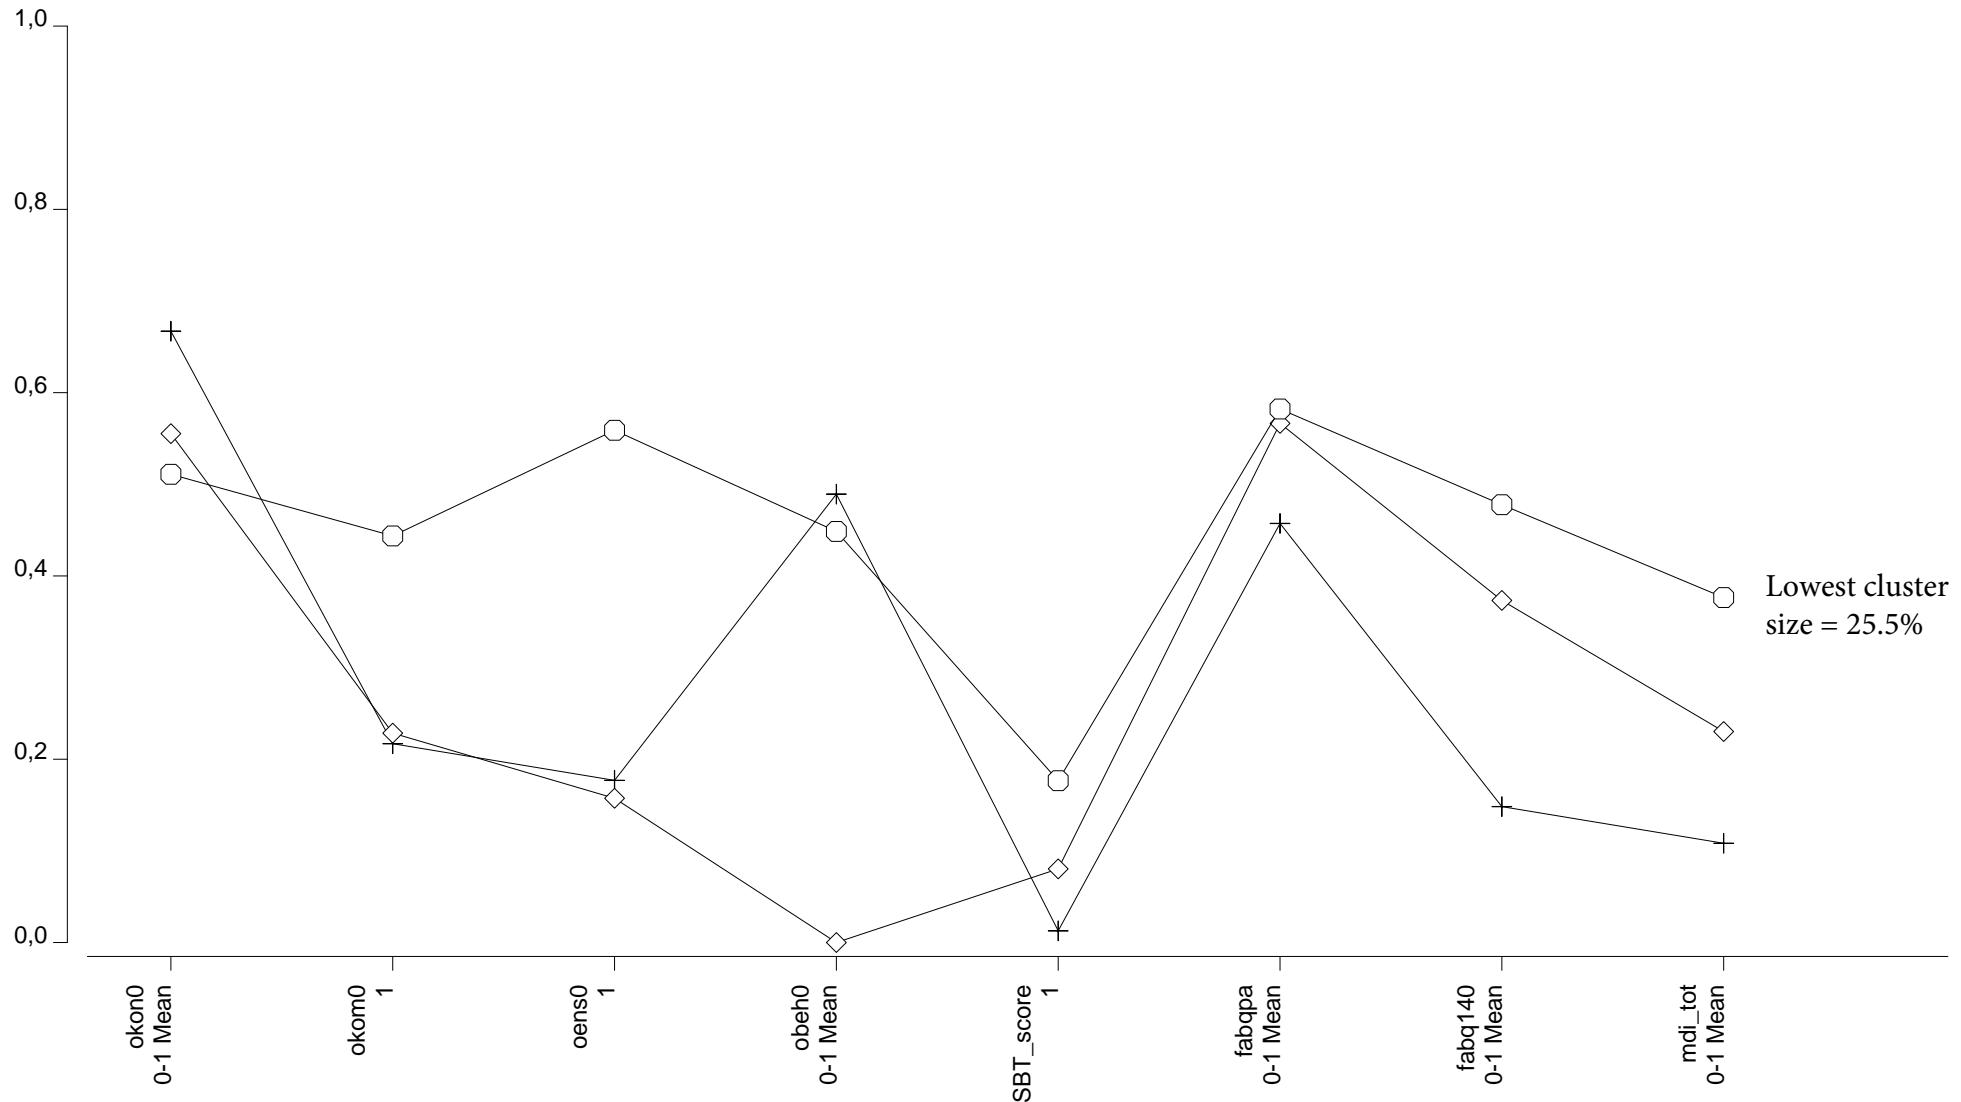

Cluster 6: The depressed patients in the high risk group with high activity limitation and unable to work because of pain

Facts:

Lowest cluster size = 3.66 % (equals approx. 34 patients out of the 928 included)

The seed number used was based on a BIC appearing 4 out of 10 rounds within the statistical analysis

Psychology domain, summary-score, 3-domain profiles

Lowest cluster size = 25.5%

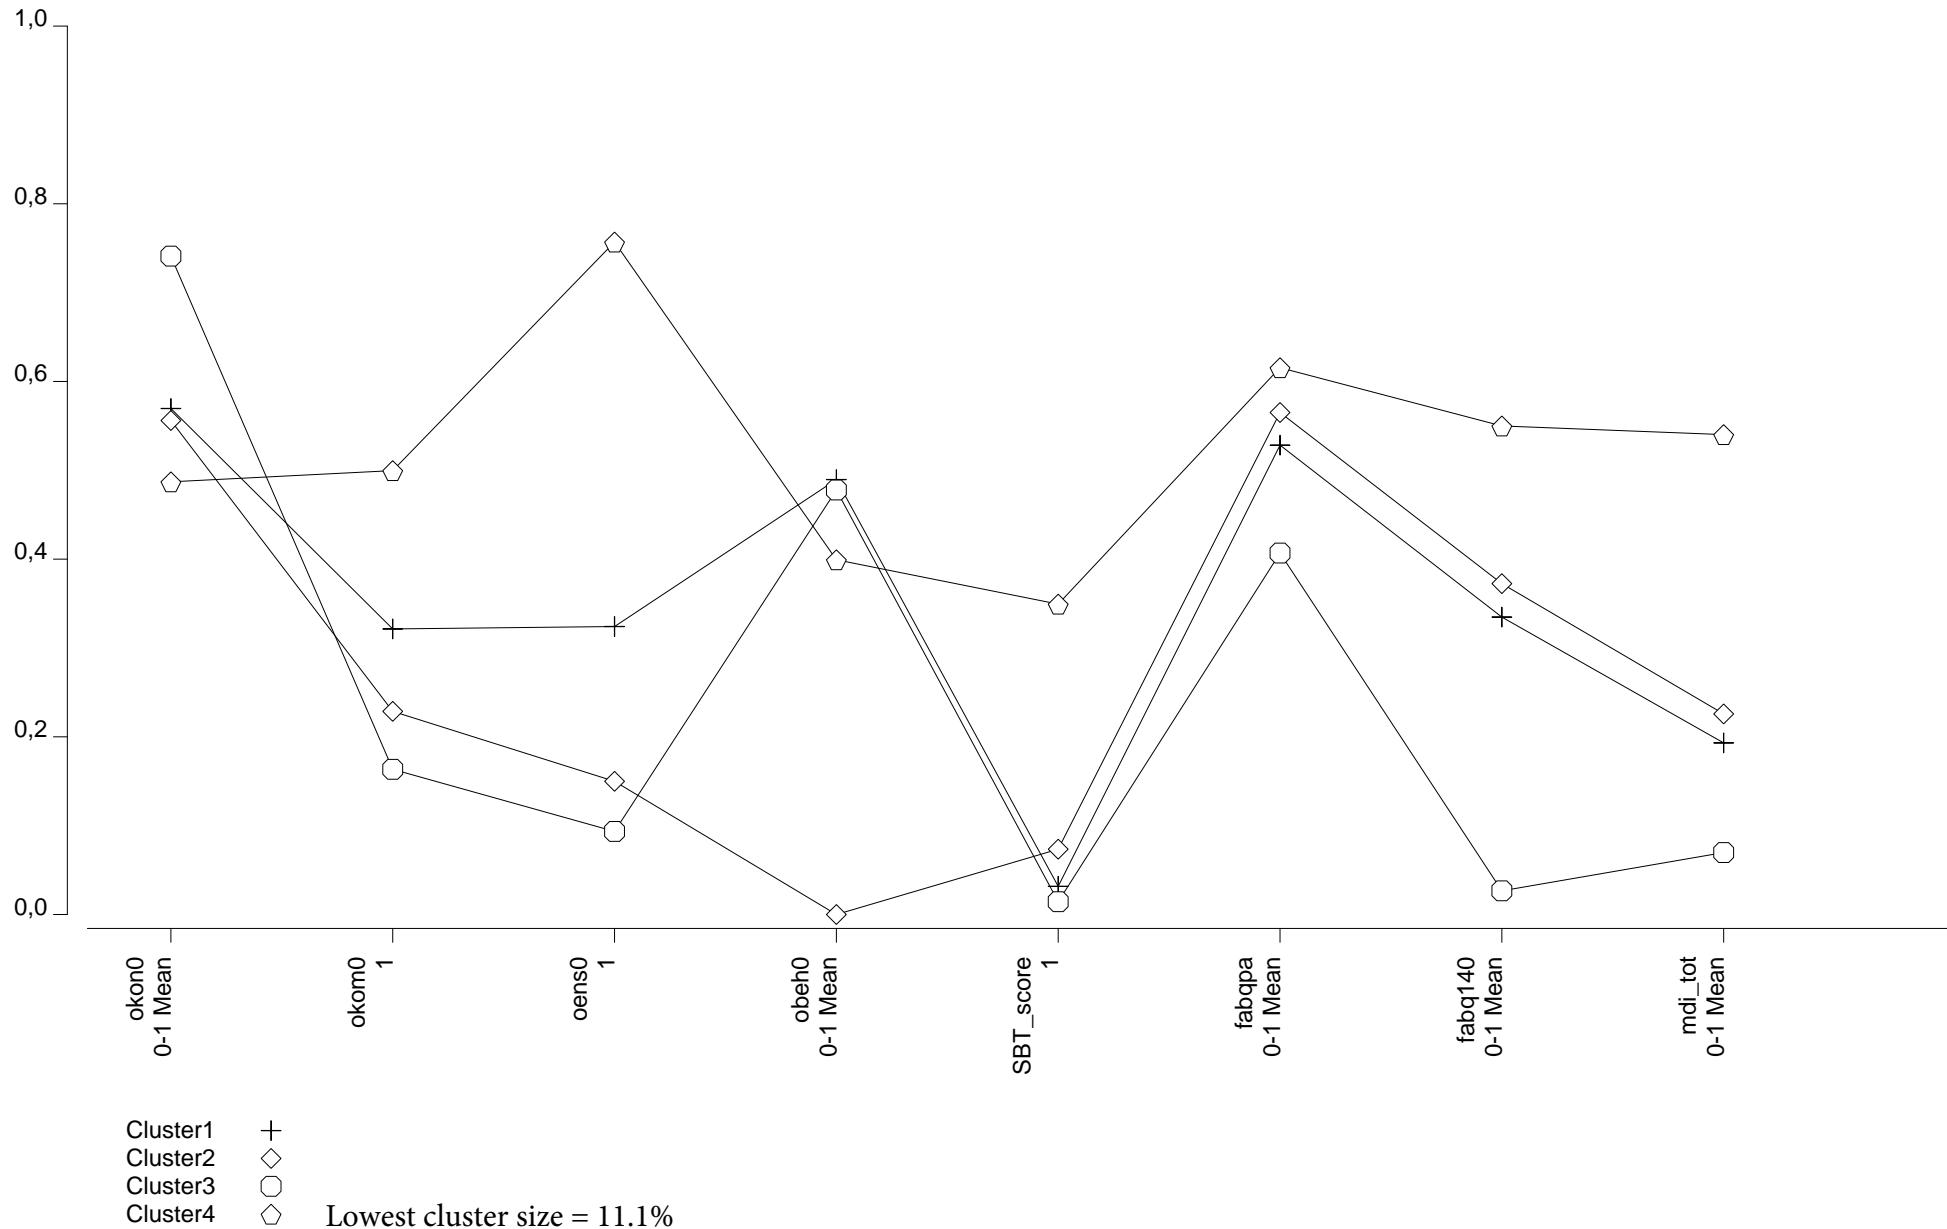

Cluster 1: Believe in recovery within 3 months, not lonely, treatment is not crucial to reduce pain and not depressed

Cluster1
Cluster2
Cluster3

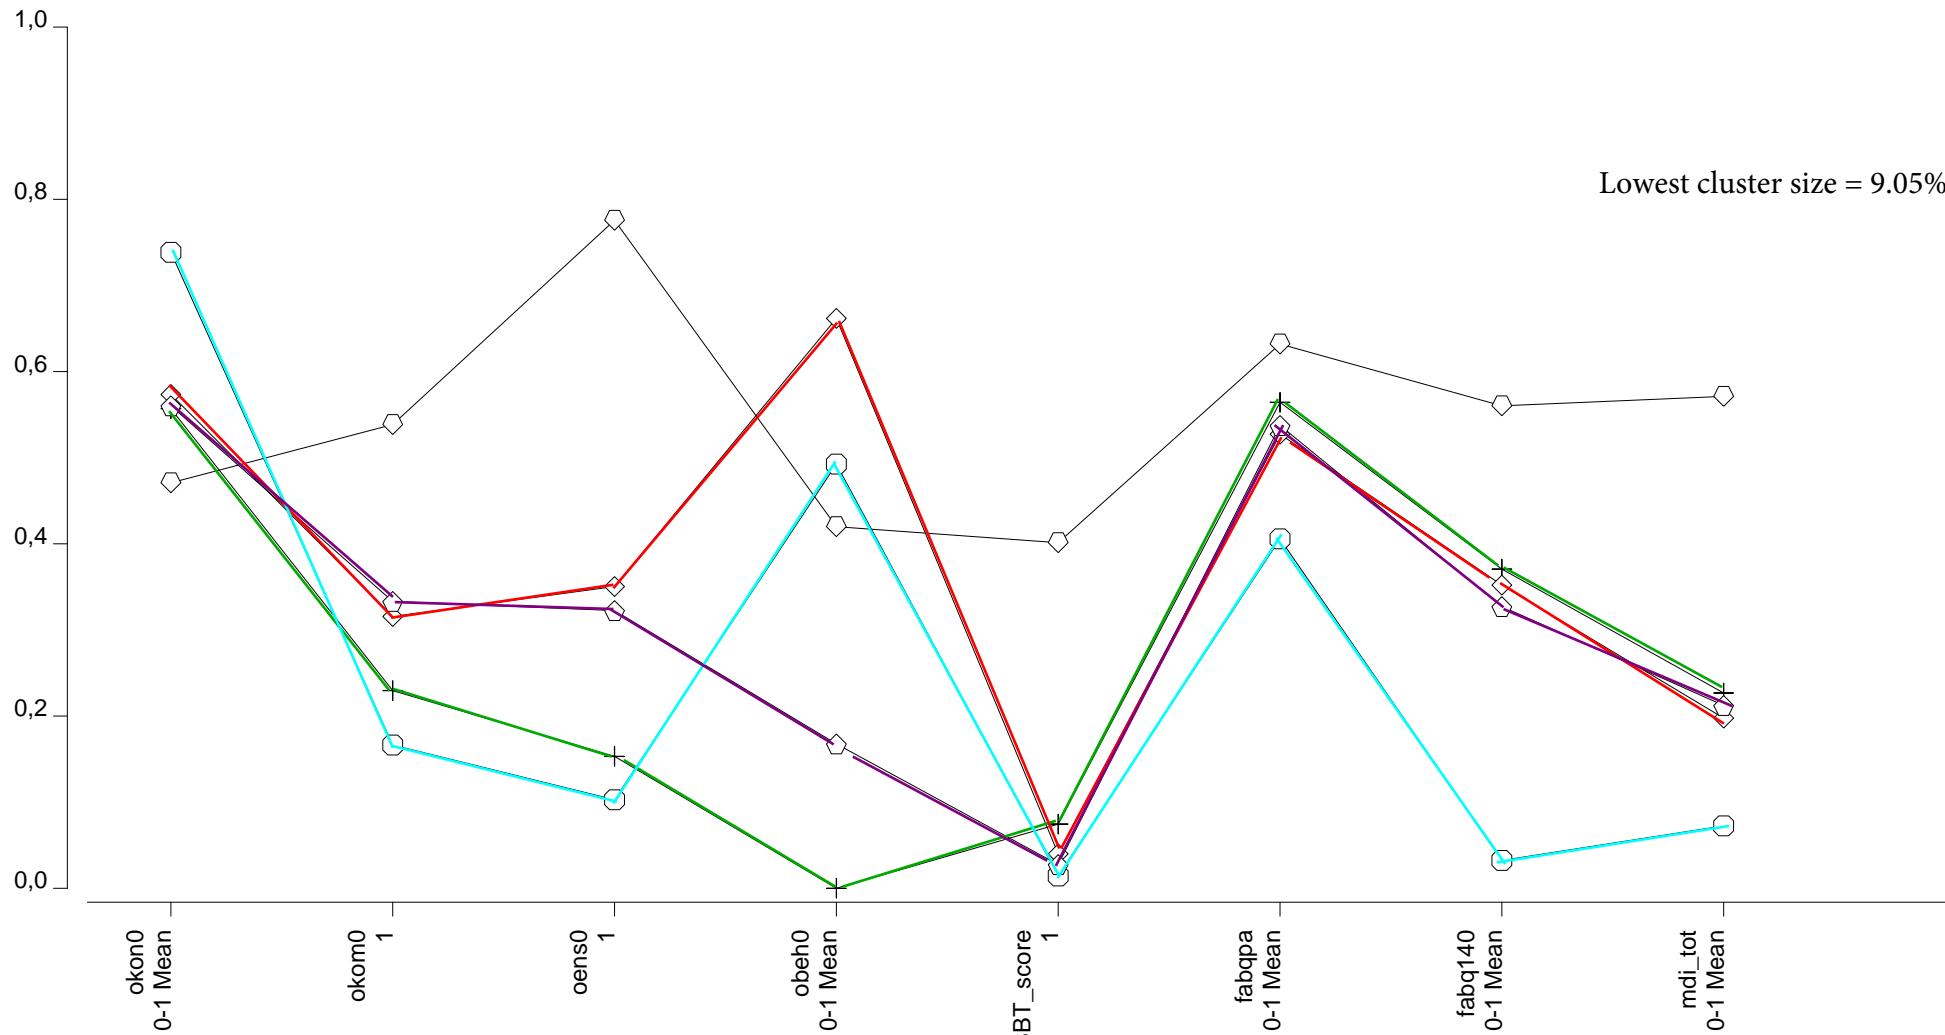

Cluster 2: Believe in recovery within 3 months, not lonely, treatment IS crucial to reduce pain and not depressed

Cluster 3: Doubt if recovered within 3 months, a little lonely, treatment is not crucial to reduce pain and slightly/moderately depressed

Psychology domain, summary-score, 4-domain profiles

Psychology domain, summary-scores, 5-domain profiles,

Cluster 1: believe in recovery, not lonely, treatment IS crucial, low risk group (SBT), slightly depressed (=cluster 2, 3class model)

Cluster 2: might believe in recovery, slightly lonely, treatment IS NOT crucial, low risk group (SBT), slightly depressed. Similar to cluster 1, but less chance of recovery and slightly lonely and treatment IS NOT crucial.

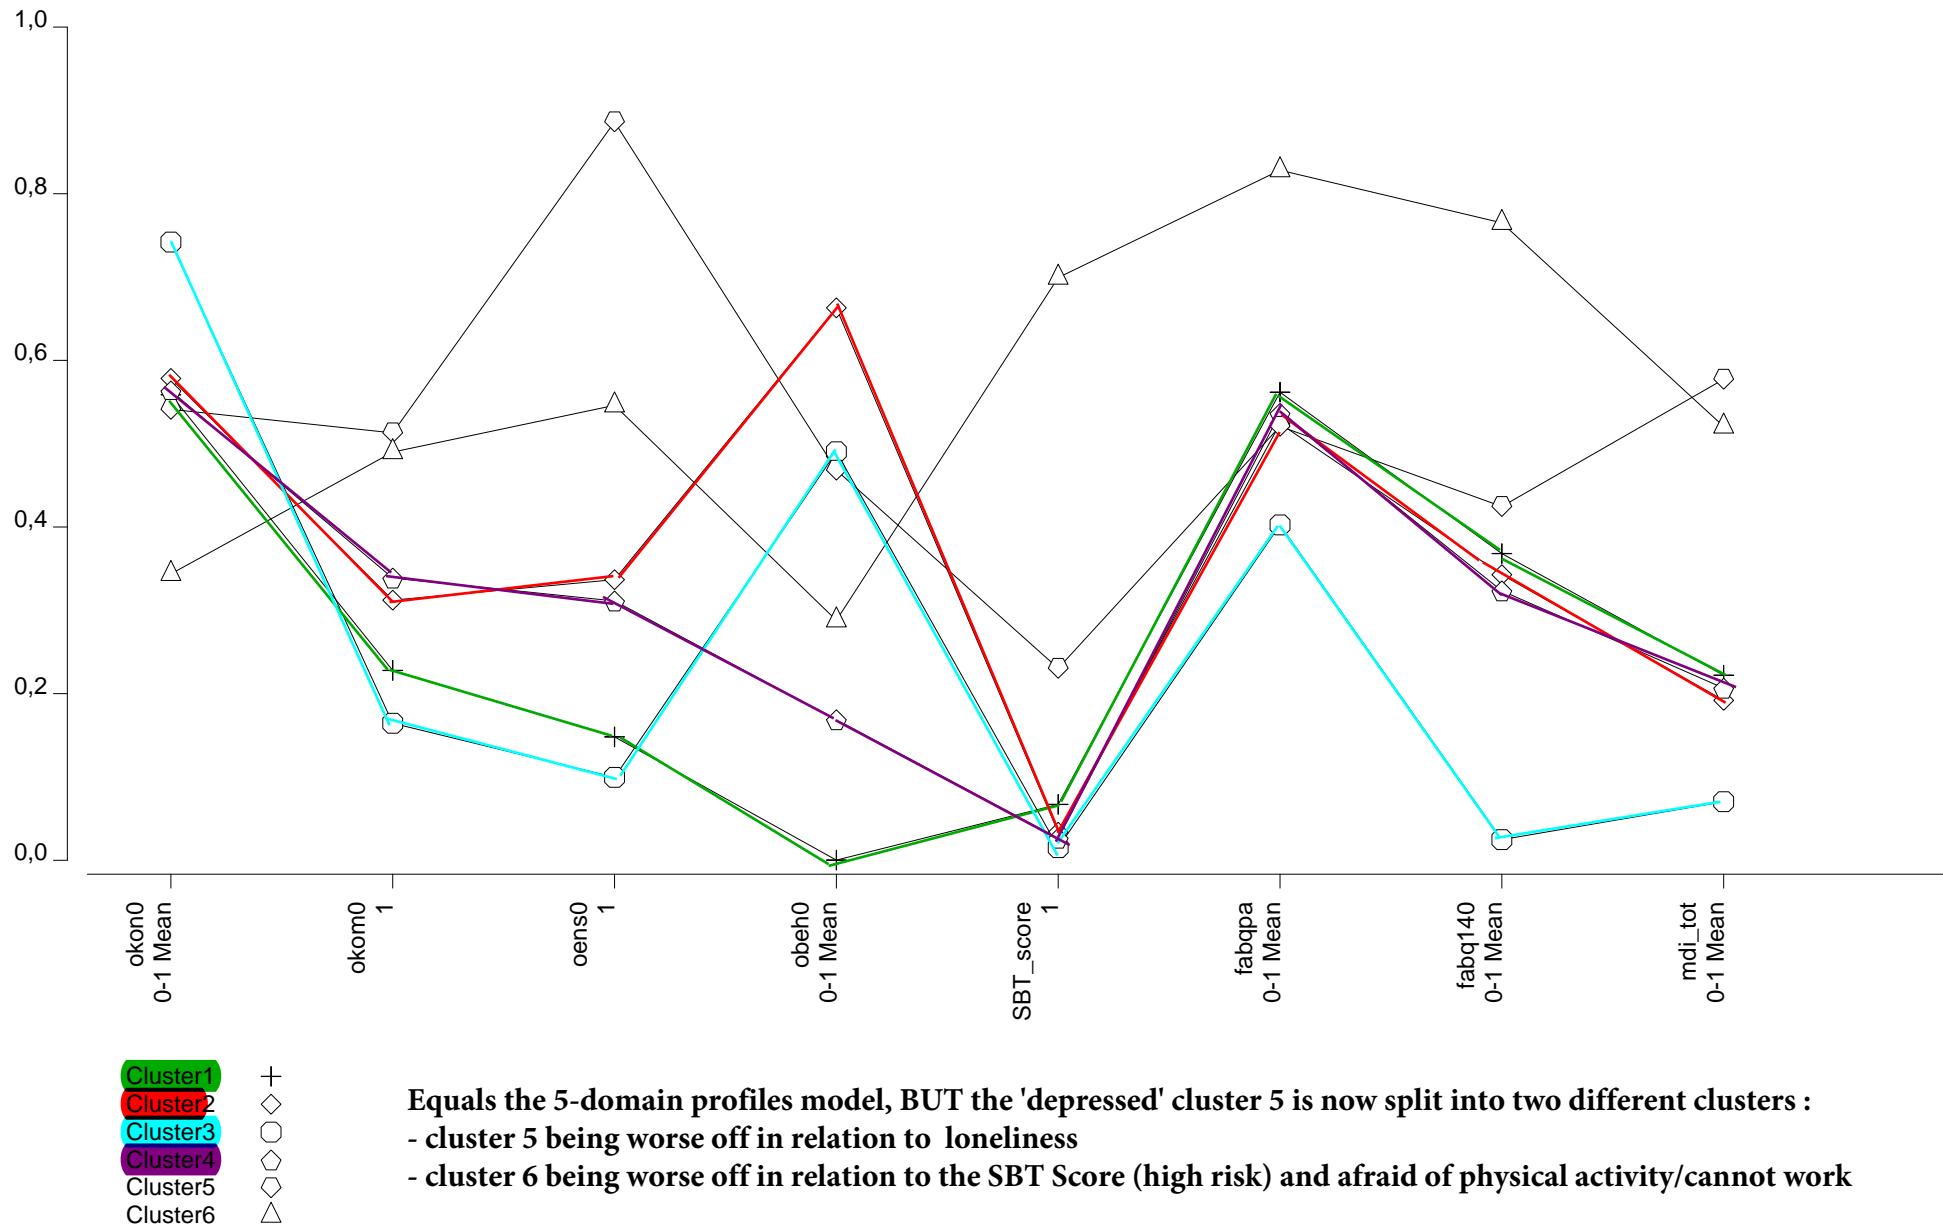

Cluster 3: control of pain, believe in recovery, not lonely, low risk group (SBT), low activity limitation, not depressed (=cluster 1, 3-class model)

Cluster 4: might recover, slightly lonely, treatment only slightly crucial, low risk group (SBT), slightly depressed. Similar to cluster 2, but differs on 'treatment variable' - treatment is fairly crucial for this cluster

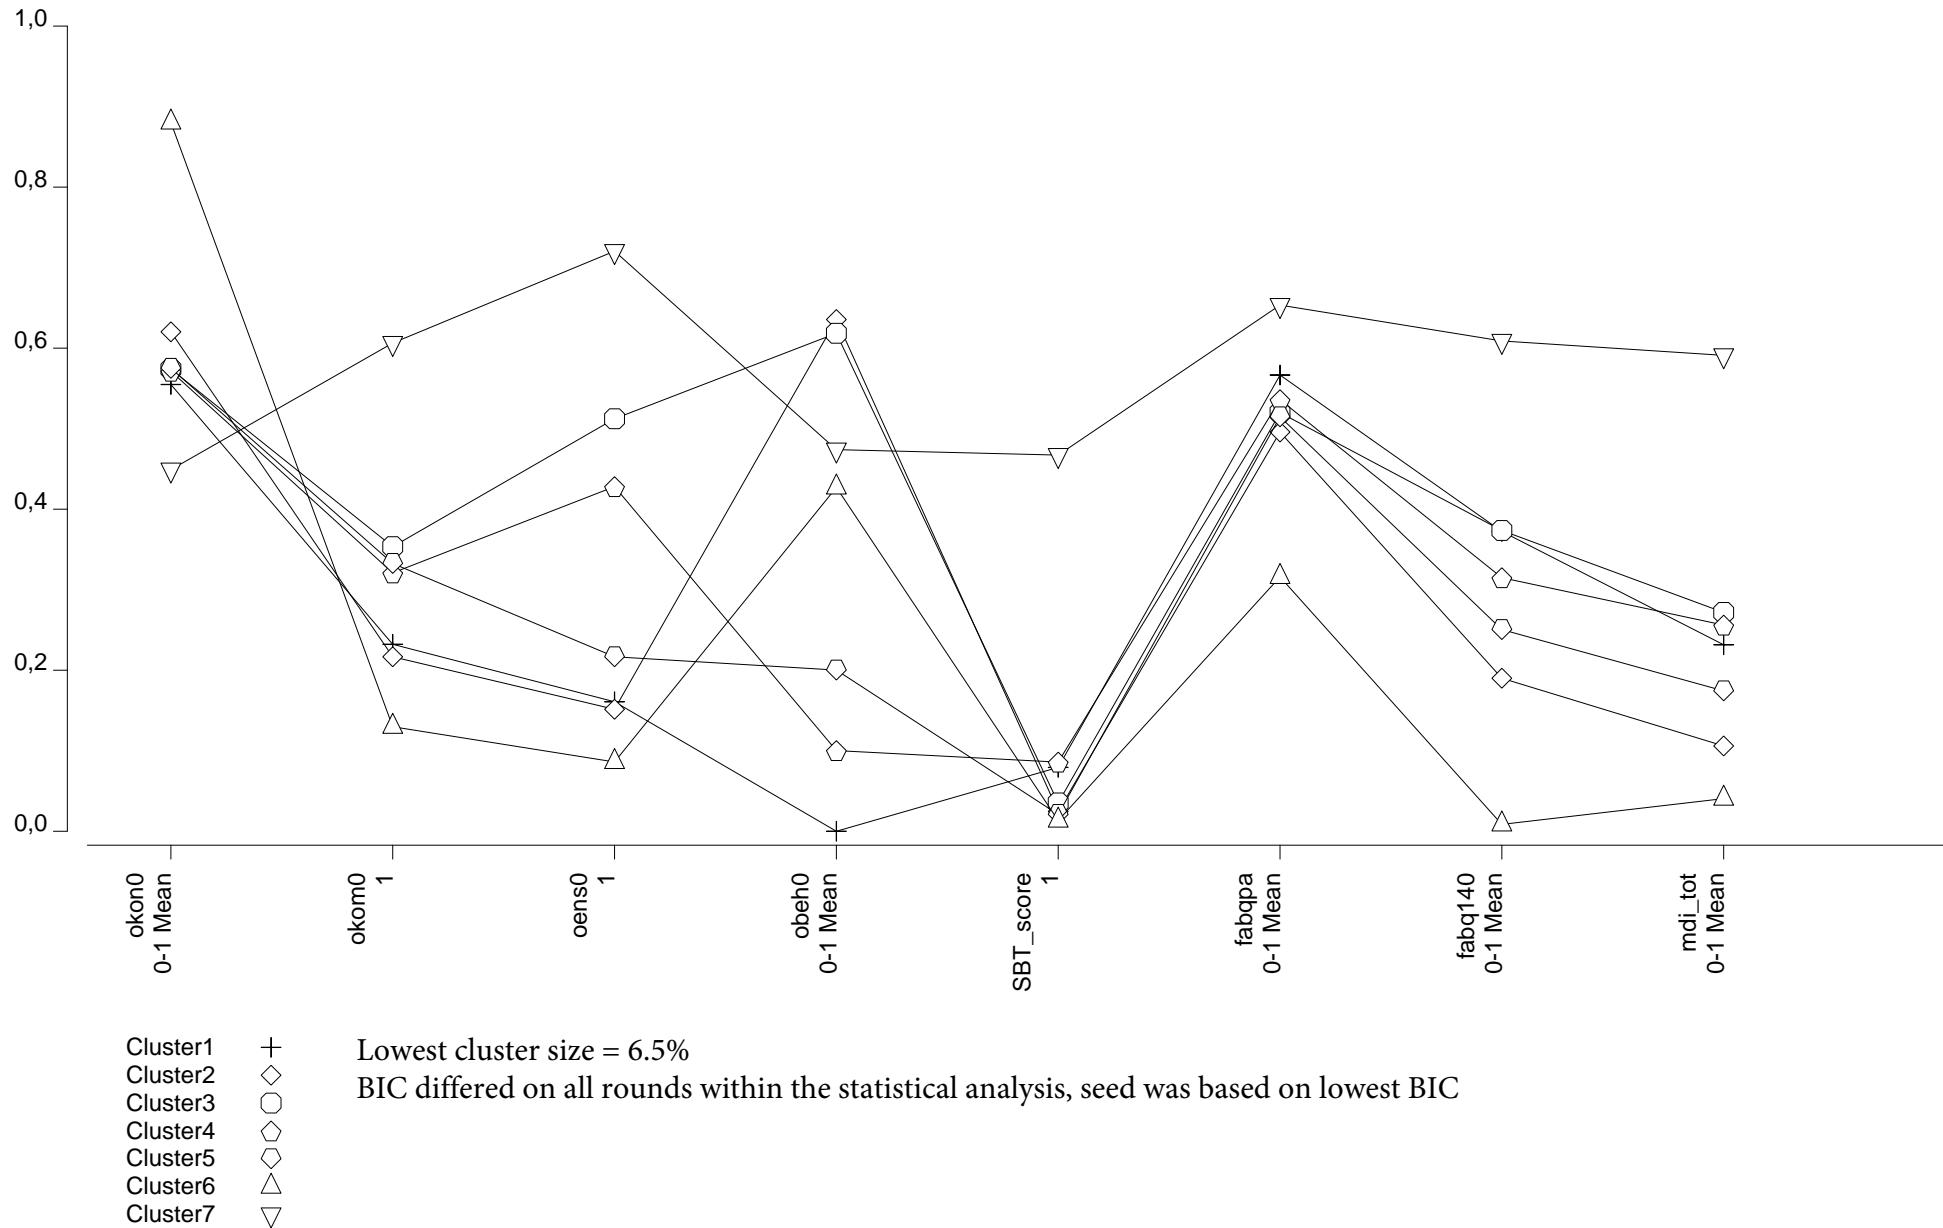

Cluster 5: some control of pain, doubt if recovered, lonely, treatment might help, high risk (SBT), activity limitation, might not be able to work before pain is treated, depressed (=cluster 3, 3class model, but more outstanding = less believe in recovery, more lonely, more depressed, high risk group (SBT), can't work before pain is treated, more depressed

Loadings – psychology domain, summary-score – 6-DP

The quantities reported under Clusters are simply correlations, representing the square root of the corresponding 'R2' or communality of the associated indicator.

Correlations: These are standardised values for the loadings reported in the Loadings output. They represent correlations between the indicators and factors.

Psychology domain, summary-score, 6-domain profiles

Pain domain v. 2 – summary-score strategy

Profile-plots: Results with 2 to 7 domain profiles based on the following variables:

Dlva0	For how long has this episode of LBP lasted? (0-2 weeks, 2-4 weeks, 1-3 months, >3 months)
Vasl0	Numeric pain rating scale, 0-10 (10=worst imaginable pain)
Vasb0	Numeric pain rating scale (0=no pain, 1 = mild pain, 2 = moderate-severe pain), ordinal variable
Tlep0	How many episodes of LBP have you had before this one? (0, 1-3, >3)
Tlda0	How many days have you had LBP within the last year? (30 days or less, >30 days)
Fabq10	My pain was caused by physical activity (0=disagree, 3 = don't know, 6=agree)
Pain_dis	Pain distribution (0=back pain only, 1=back pain and pain in one leg, 2=back pain and pain in two legs, 3=only leg pain)?
Domin_bp	Dominating back pain? (0=no, 1=yes)
Paraspin_debut	Paraspinal pain onset? (0=no, 1=yes)

AMN's suggestion on final model: 6 domain profiles (clusters) both based on statistical criteria and profile plots

Cluster 1: very short duration of BP, high intensity back pain, no leg pain

Cluster 2: very short duration of BP, high intensity back pain, high intensity leg pain, often only back pain, but sometimes pain in one leg,

Cluster 3: short duration of BP, low intensity back pain, very often only back pain

Cluster 4: long duration of BP (>1 month), moderate intensity back pain, low intensity leg pain, more than 30 days of LBP last year, very often only back pain

Cluster 5: long duration of back pain (>1 month), high intensity back pain, very high intensity leg pain, more than 30 days of LBP last year, often back pain and pain in one leg, often dominating back pain

Cluster 6: short duration of BP, moderate intensity back pain, very high intensity leg pain, often back pain and pain in one leg, but sometimes only leg pain, very often leg pain is dominating (very seldom back pain is dominating)

Pain domain version 2: the variable 'leg pain intensity' was used as continuous in version 1 (results not shown) and ordinal in version 2

Description of model: Pain domain v.2, summary-score strategy, 6-domain profiles

Variables not mentioned in the description: tlep0, fabq10, paraspin_debut (cf. reduced profile plot of final model)

Cluster 1: 0-2 weeks of back pain (**very short duration of BP**), **high intensity back pain**, very low intensity leg pain, less than 30 days of LBP last year, very often dominating back pain, **no leg pain**

Cluster 2: 0-2 weeks of back pain (very short duration of BP), high intensity back pain, high intensity leg pain, less than 30 days of LBP last year, often only back pain, but sometimes pain in one leg, very often dominating back pain

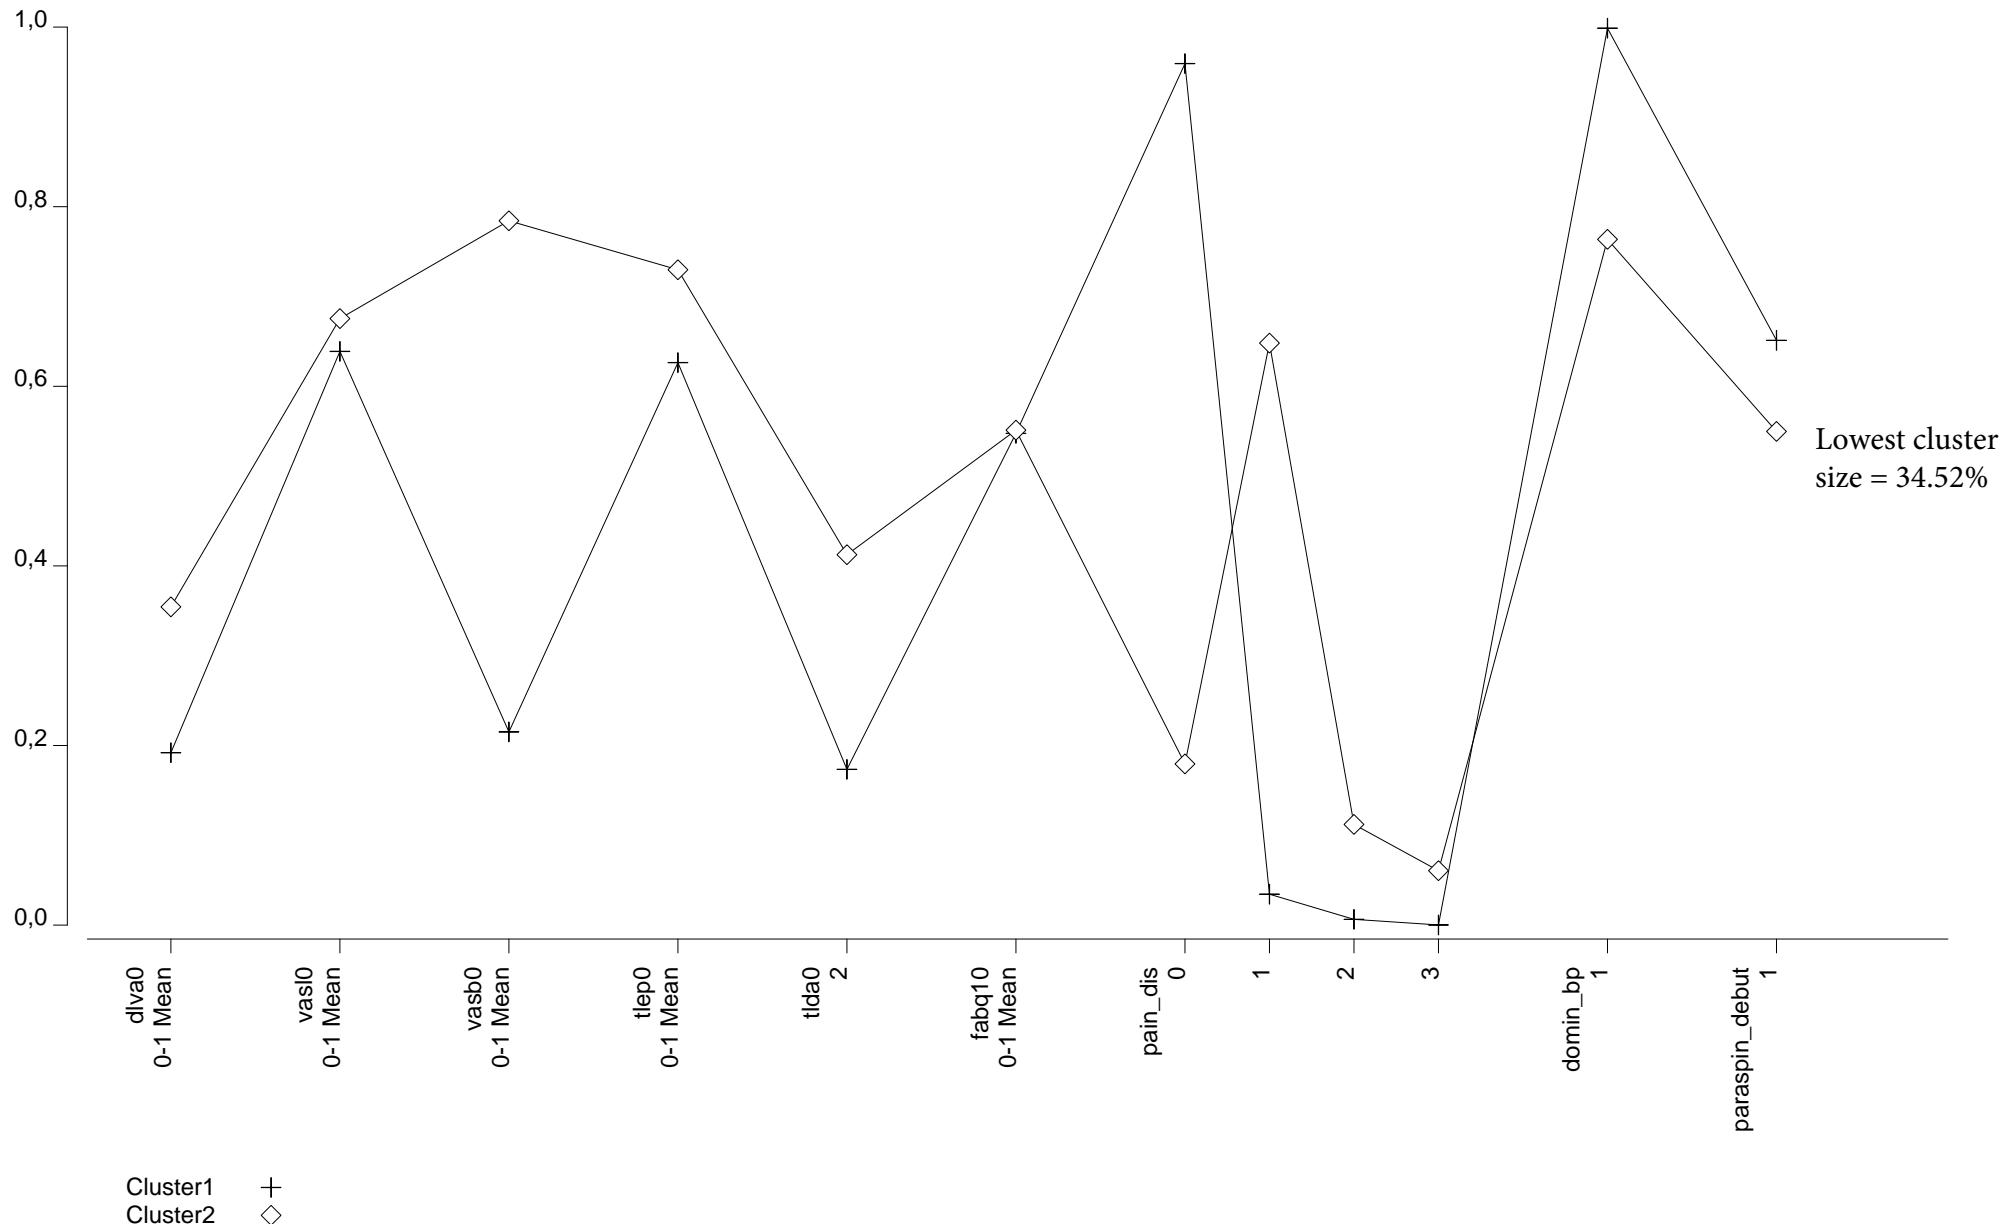

Cluster 3: 0-4 weeks of back pain (short duration of BP), low intensity back pain, very low intensity leg pain, less than 30 days of LBP last year, very often only back pain and dominating back pain

Cluster 4: long duration of BP (>1 month), moderate intensity back pain, low intensity leg pain, more than 30 days of LBP last year, very often only back pain, very often dominating back pain

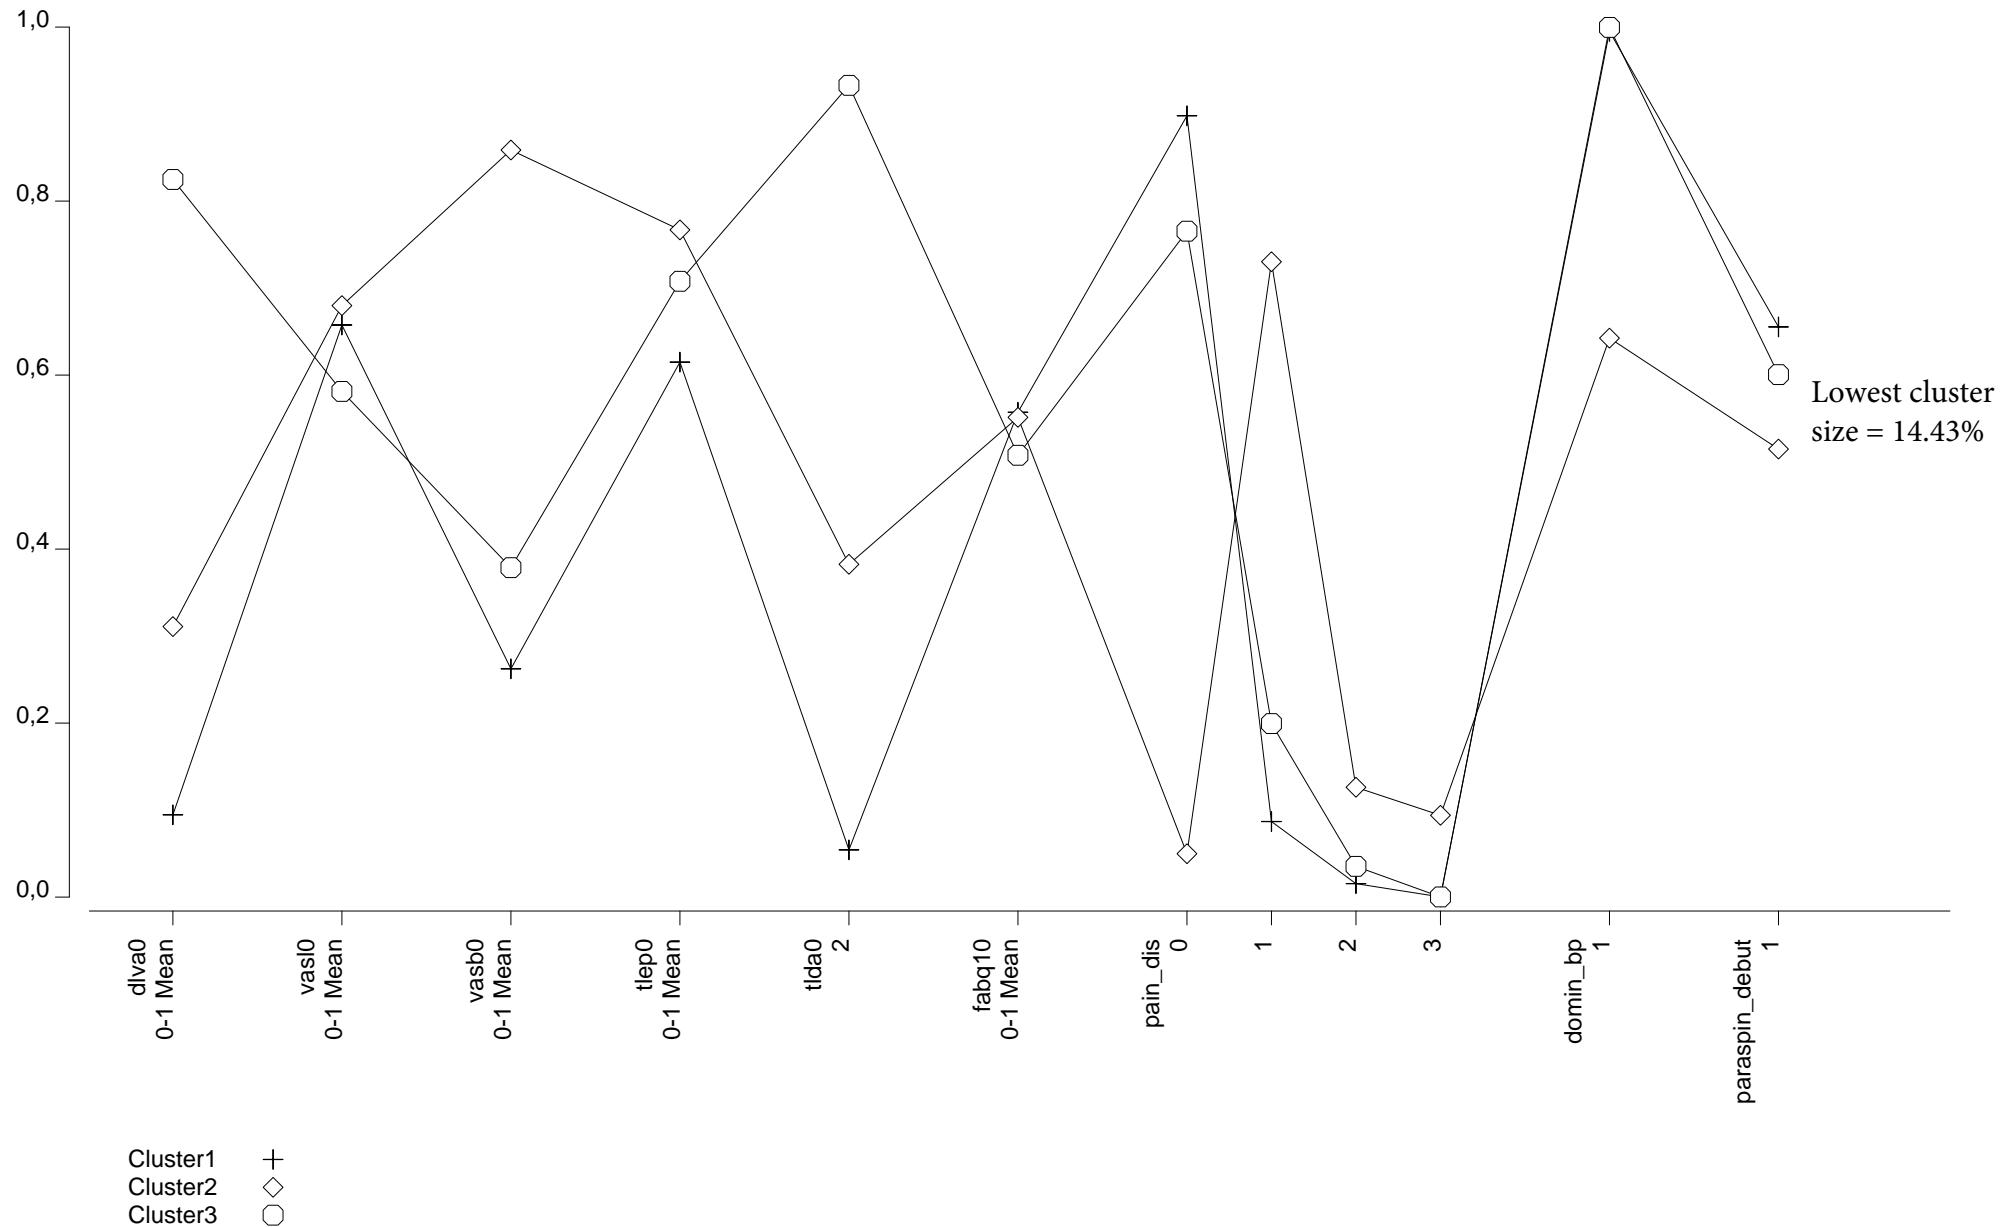

Cluster 5: long duration of back pain (>1 month), high intensity back pain, very high intensity leg pain, more than 30 days of LBP last year, often back pain and pain in one leg, often dominating back pain

Cluster 6: 0-4 weeks of back pain (short duration of BP), moderate intensity back pain, very high intensity leg pain, less than 30 days of LBP last year, often back pain and pain in one leg, but sometimes only leg pain, very often leg pain is dominating (very seldom back pain is dominating)

Profiles in numbers – pain domain v.2, 6-DP, sum.score

The first row of numbers shows how large each cluster is. The body of the table contains (marginal) conditional probabilities that show how the clusters are related to the Nominal or Ordinal indicator variables. These probabilities sum to 1 within each cluster (column). For indicators specified as Continuous, the body of the table contains means instead of probabilities. For indicators specified as Ordinal, means are displayed in addition to the conditional probabilities

Activity domain – summary-score strategy

Profile-plots: Results with 2 to 7 domain profiles based on the following variables:

Rmprop	Sum-score representing the Roland Morris Disability Questionnaire. The higher score the more activity limitation
Fabq130	I cannot do my normal work with my present pain (disagree, don't know, agree)
facetsit	Best posture is to sit (1=yes)
facetwalk	Best activity is to walk (1=yes)

AMN's suggestion on final model: 5 domain profiles (clusters) – profile plot at page 5

Cluster 1: Moderate activity limitation, ok to work despite pain, prefer to walk

Cluster 2: Fairly high activity limitation, might be able to work, prefer to walk

Cluster 3: Low activity limitation, can work, prefer to walk

Cluster 4: Fairly high activity limitation, cannot work, prefer to walk

Cluster 5: Fairly high activity limitation, might be able to work, prefer to sit

Facts:

Lowest cluster size = 5.27 %

The seed used was based on the lowest BIC appearing 4 out of 10 rounds within the statistical analysis

AMN's suggestion on final model: 7-domain profiles (clusters)

Facts:

Lowest cluster size = 8.9%

The used seed was based on the BIC appearing most often (4/10) within the statistical analysis

Description of clusters – activity domain, summary-score strategy – 7-domain profiles

Bold text where the probability of the subgroup solution described is above 80% and 'rmprop s.e.' less than 5.00.

Cluster 1: High activity limitation, fully agree that cannot work with present pain, fully disagree on 'best posture is to sit' and agree on 'best activity is to walk'

Cluster 2: High activity limitation, fully disagree that cannot work with present pain, fully disagree on 'best posture is to sit' and agree on 'best activity is to walk'

Cluster 3: Moderate activity limitation, disagree that cannot work with present pain, don't know if 'best posture is to sit', agree on 'best activity is to walk' (a lot of variation within the profile, 'the garbage bag')

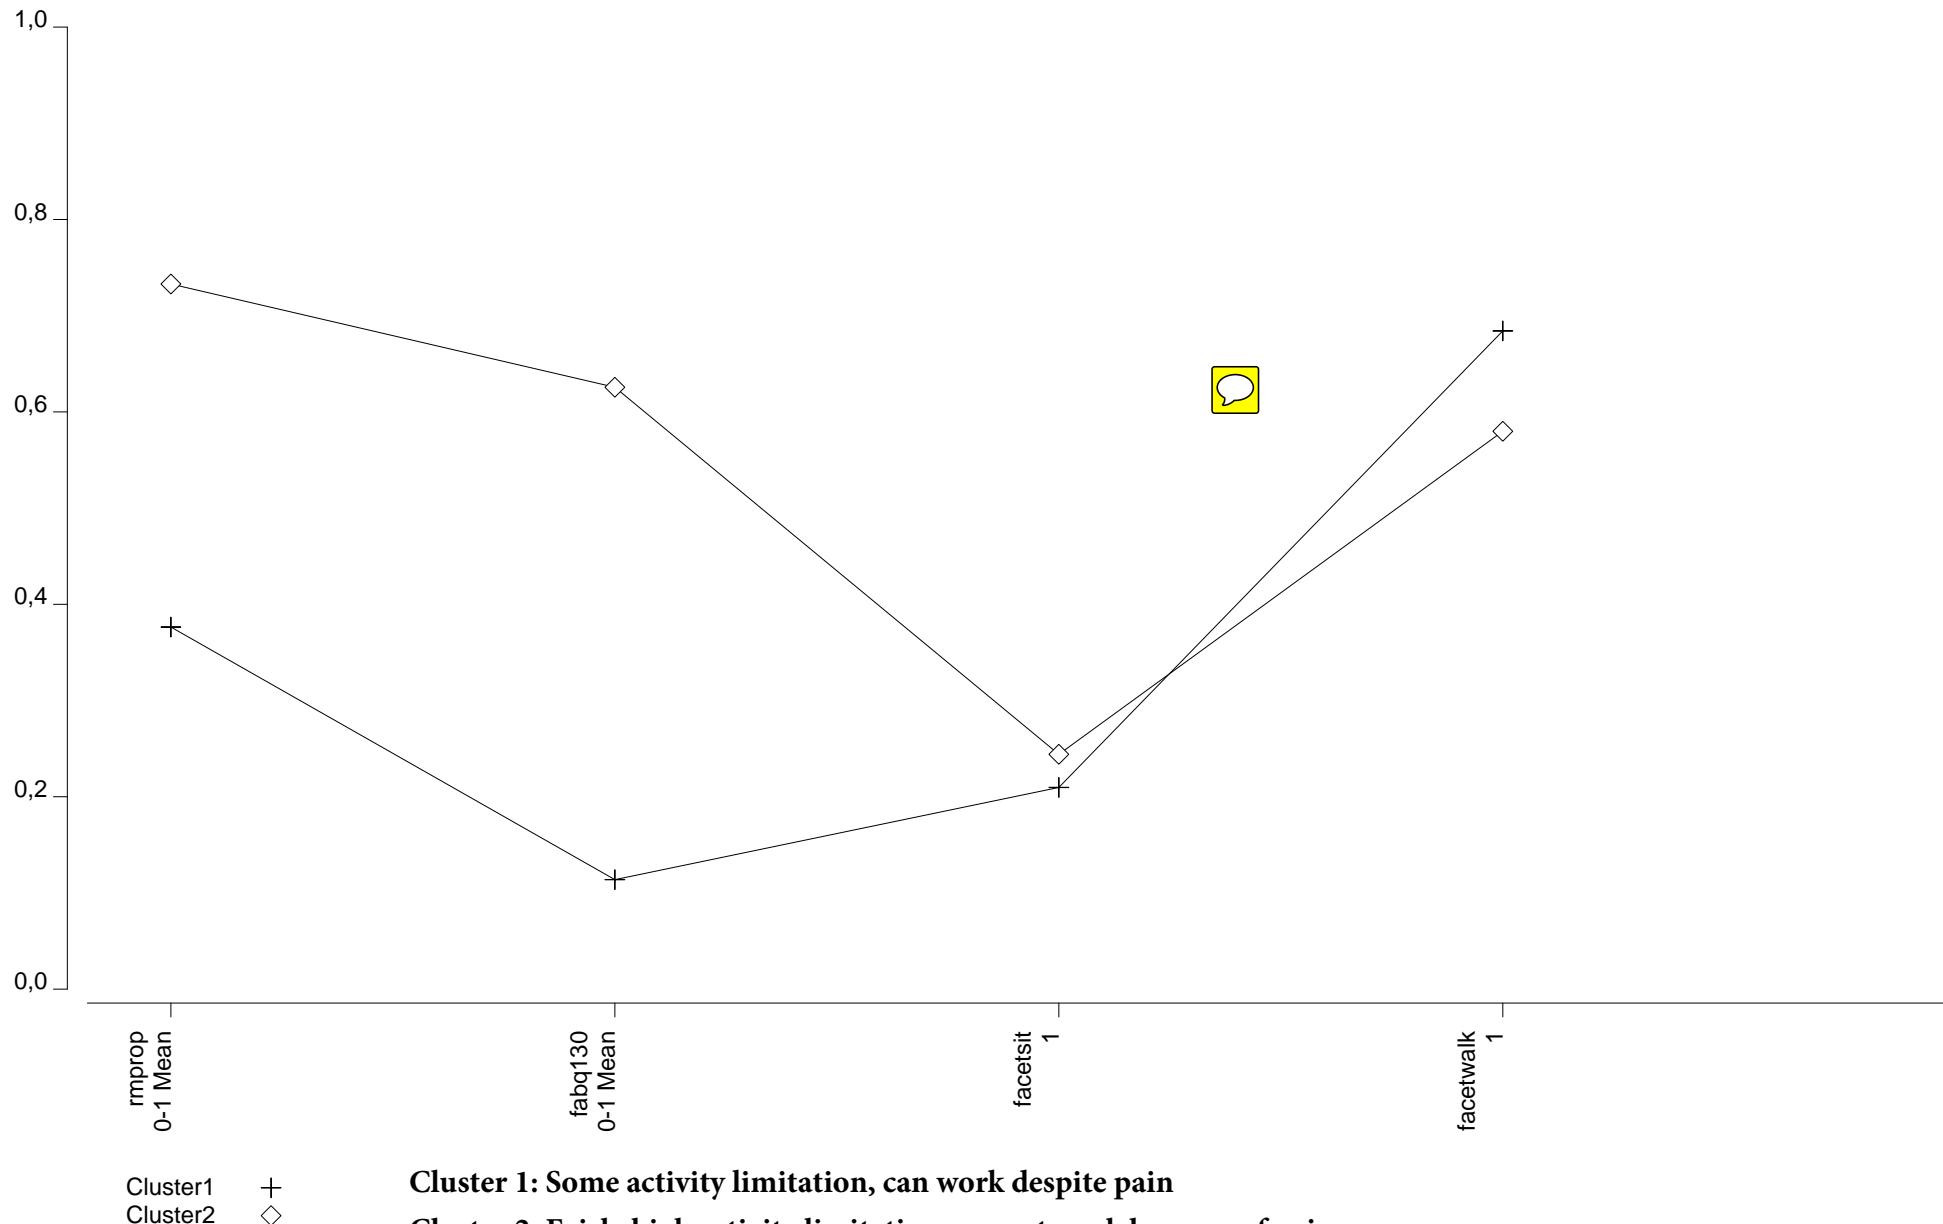

Cluster 4: Low activity limitation, fully disagree that cannot work with present pain, fully disagree on 'best posture is to sit', fully agree on 'best activity is to walk'

Cluster 5: Very low activity limitation, fully disagree that cannot work with present pain, disagree on 'best posture is to sit', fully agree on 'best activity is to walk'

Cluster 6: Low activity limitation, fully disagree that cannot work with present pain, fully disagree on 'best posture is to sit', fully disagree on 'best activity is to walk'

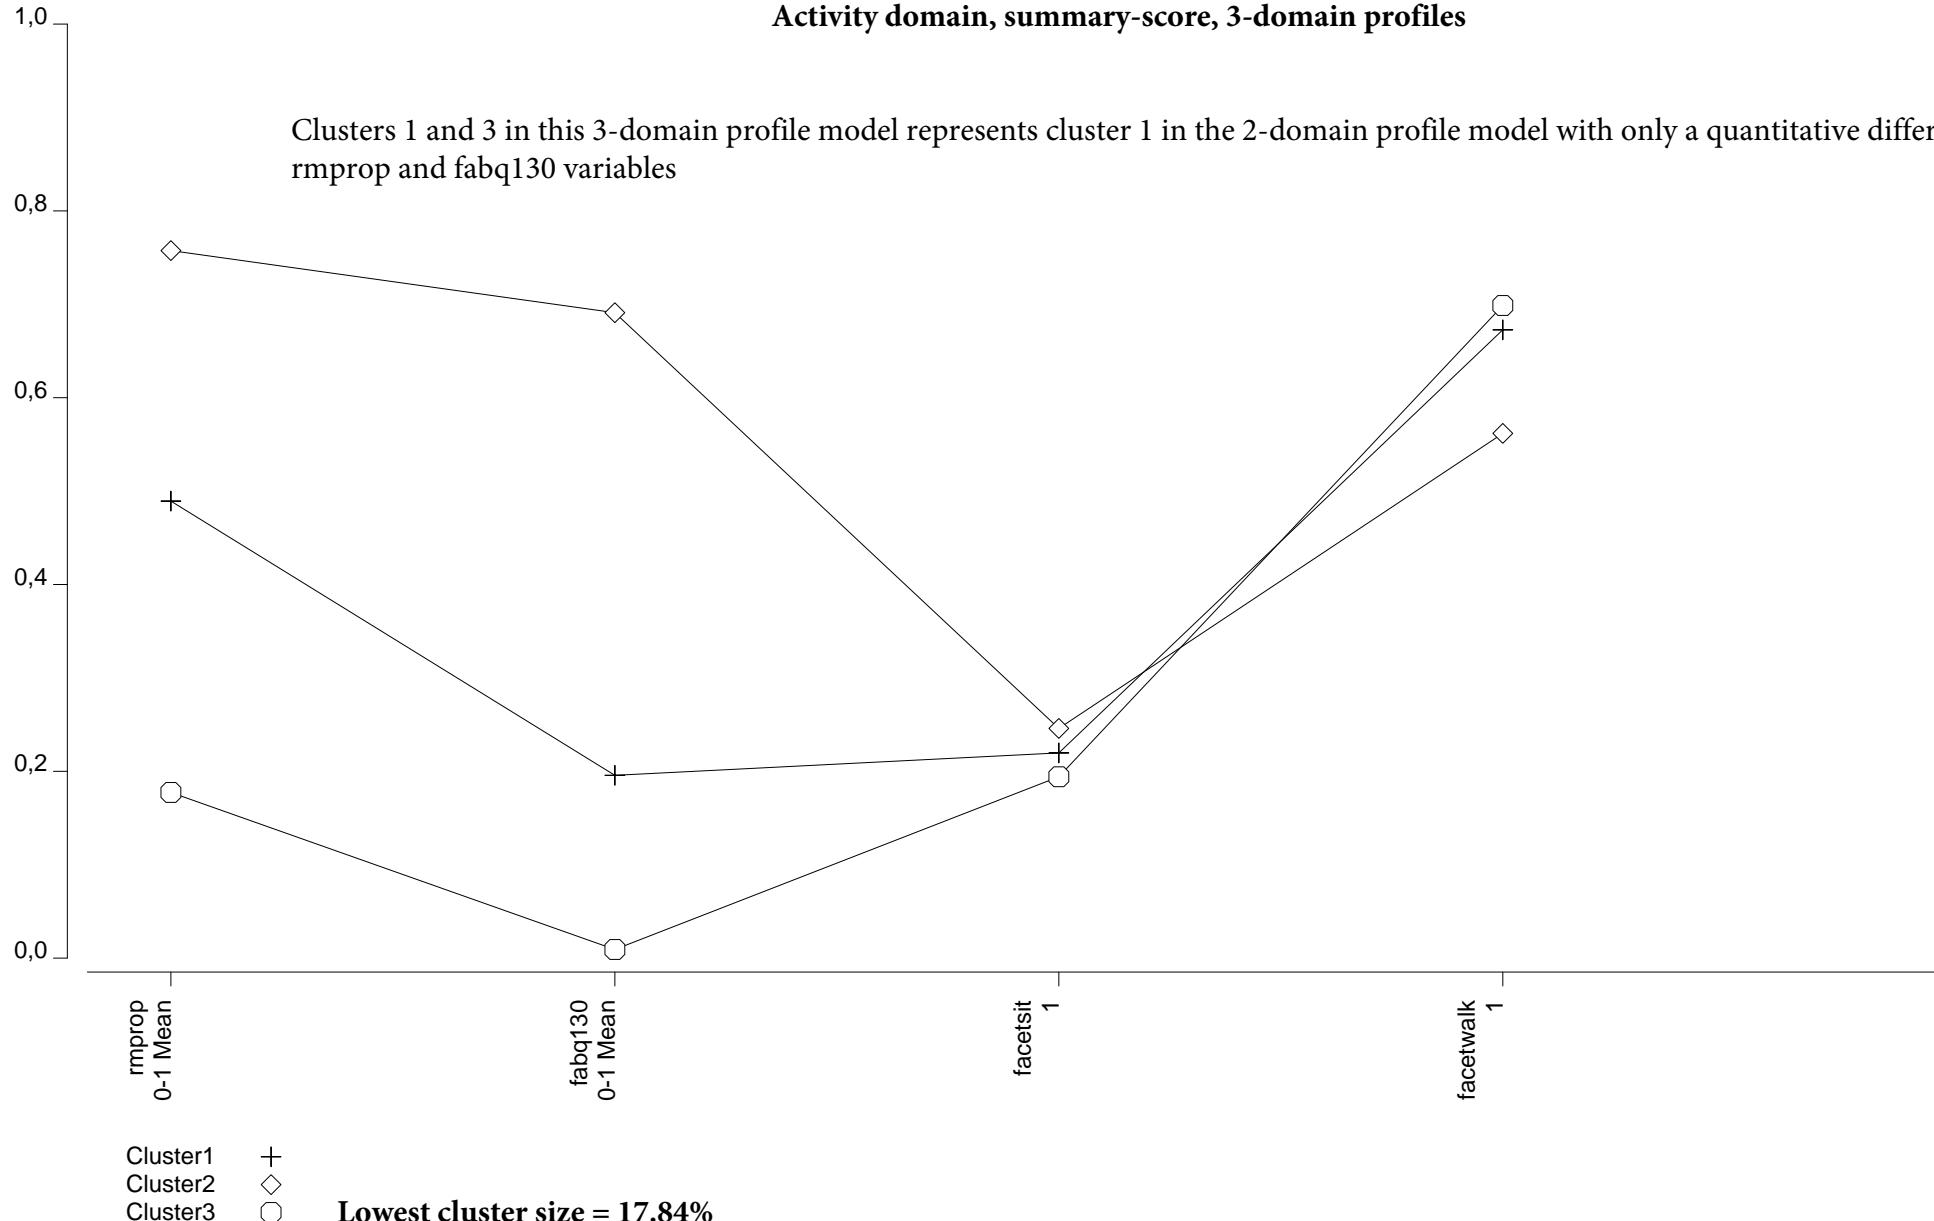

Cluster 7: High activity limitation, don't know if one cannot work with present pain, don't know if 'best posture is to sit' and **fully disagree on 'best activity is to walk'**

Activity domain, summary-score, 2-domain profiles

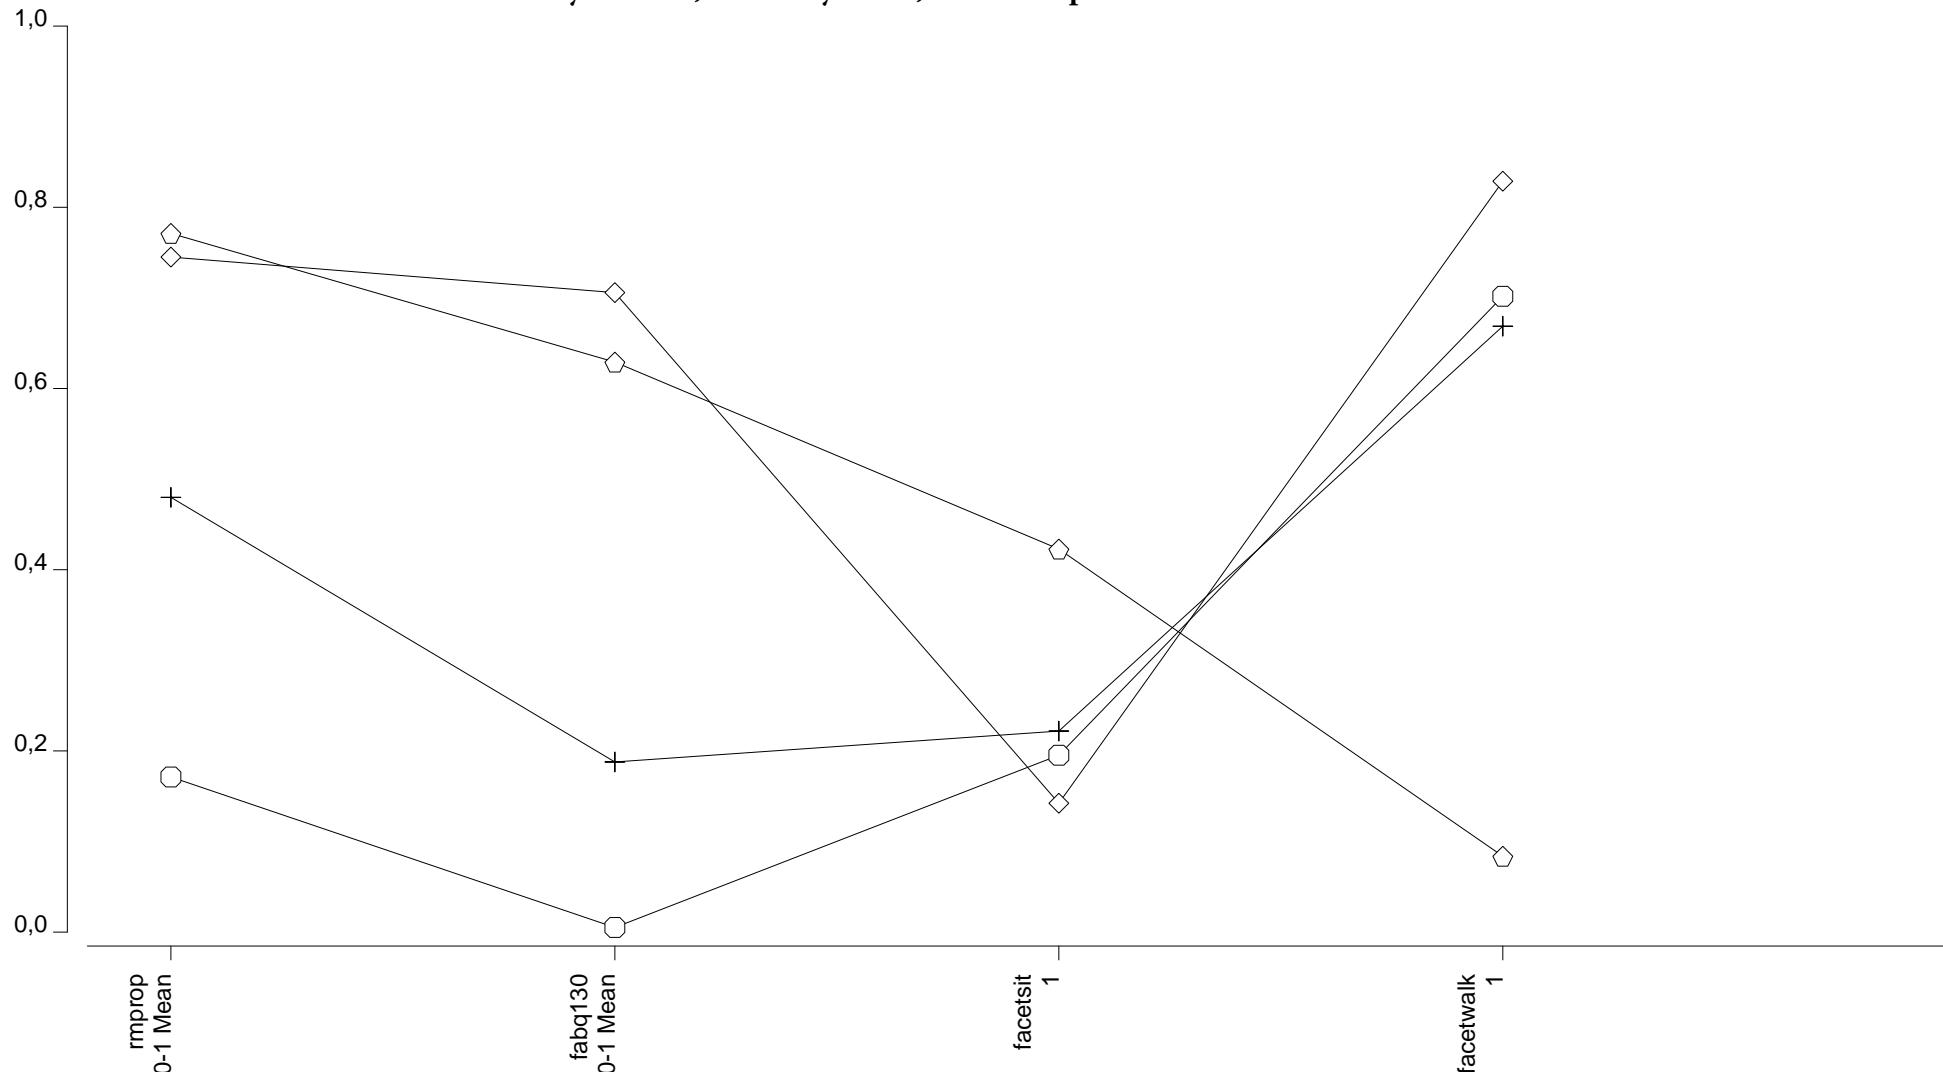

Activity domain, summary-score, 3-domain profiles

Clusters 1 and 3 in this 3-domain profile model represents cluster 1 in the 2-domain profile model with only a quantitative difference in the rmprop and fabq130 variables

Activity domain, summary-score, 4-domain profiles

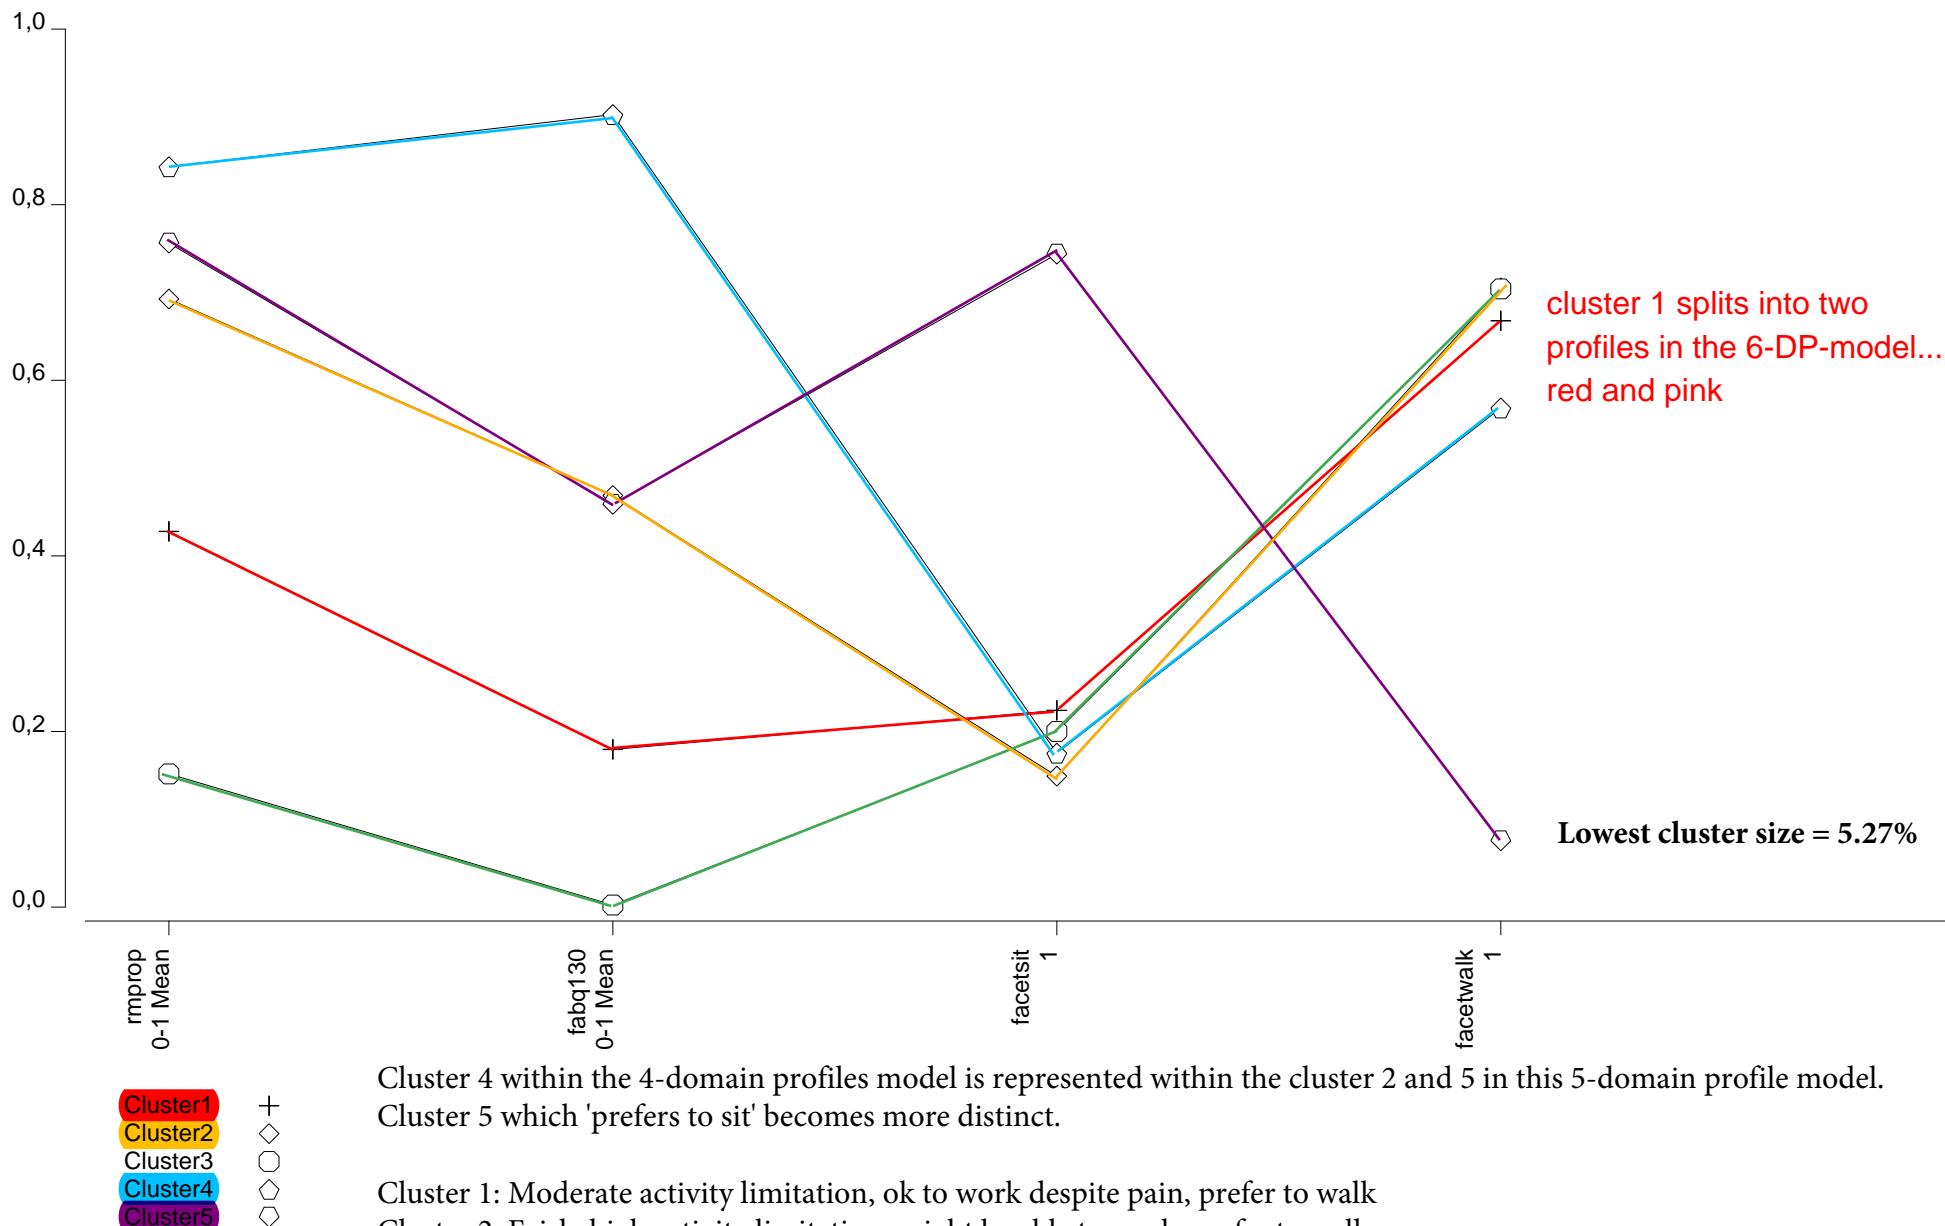

Cluster1 +
 Cluster2 ◇
 Cluster3 ○
 Cluster4 ◇

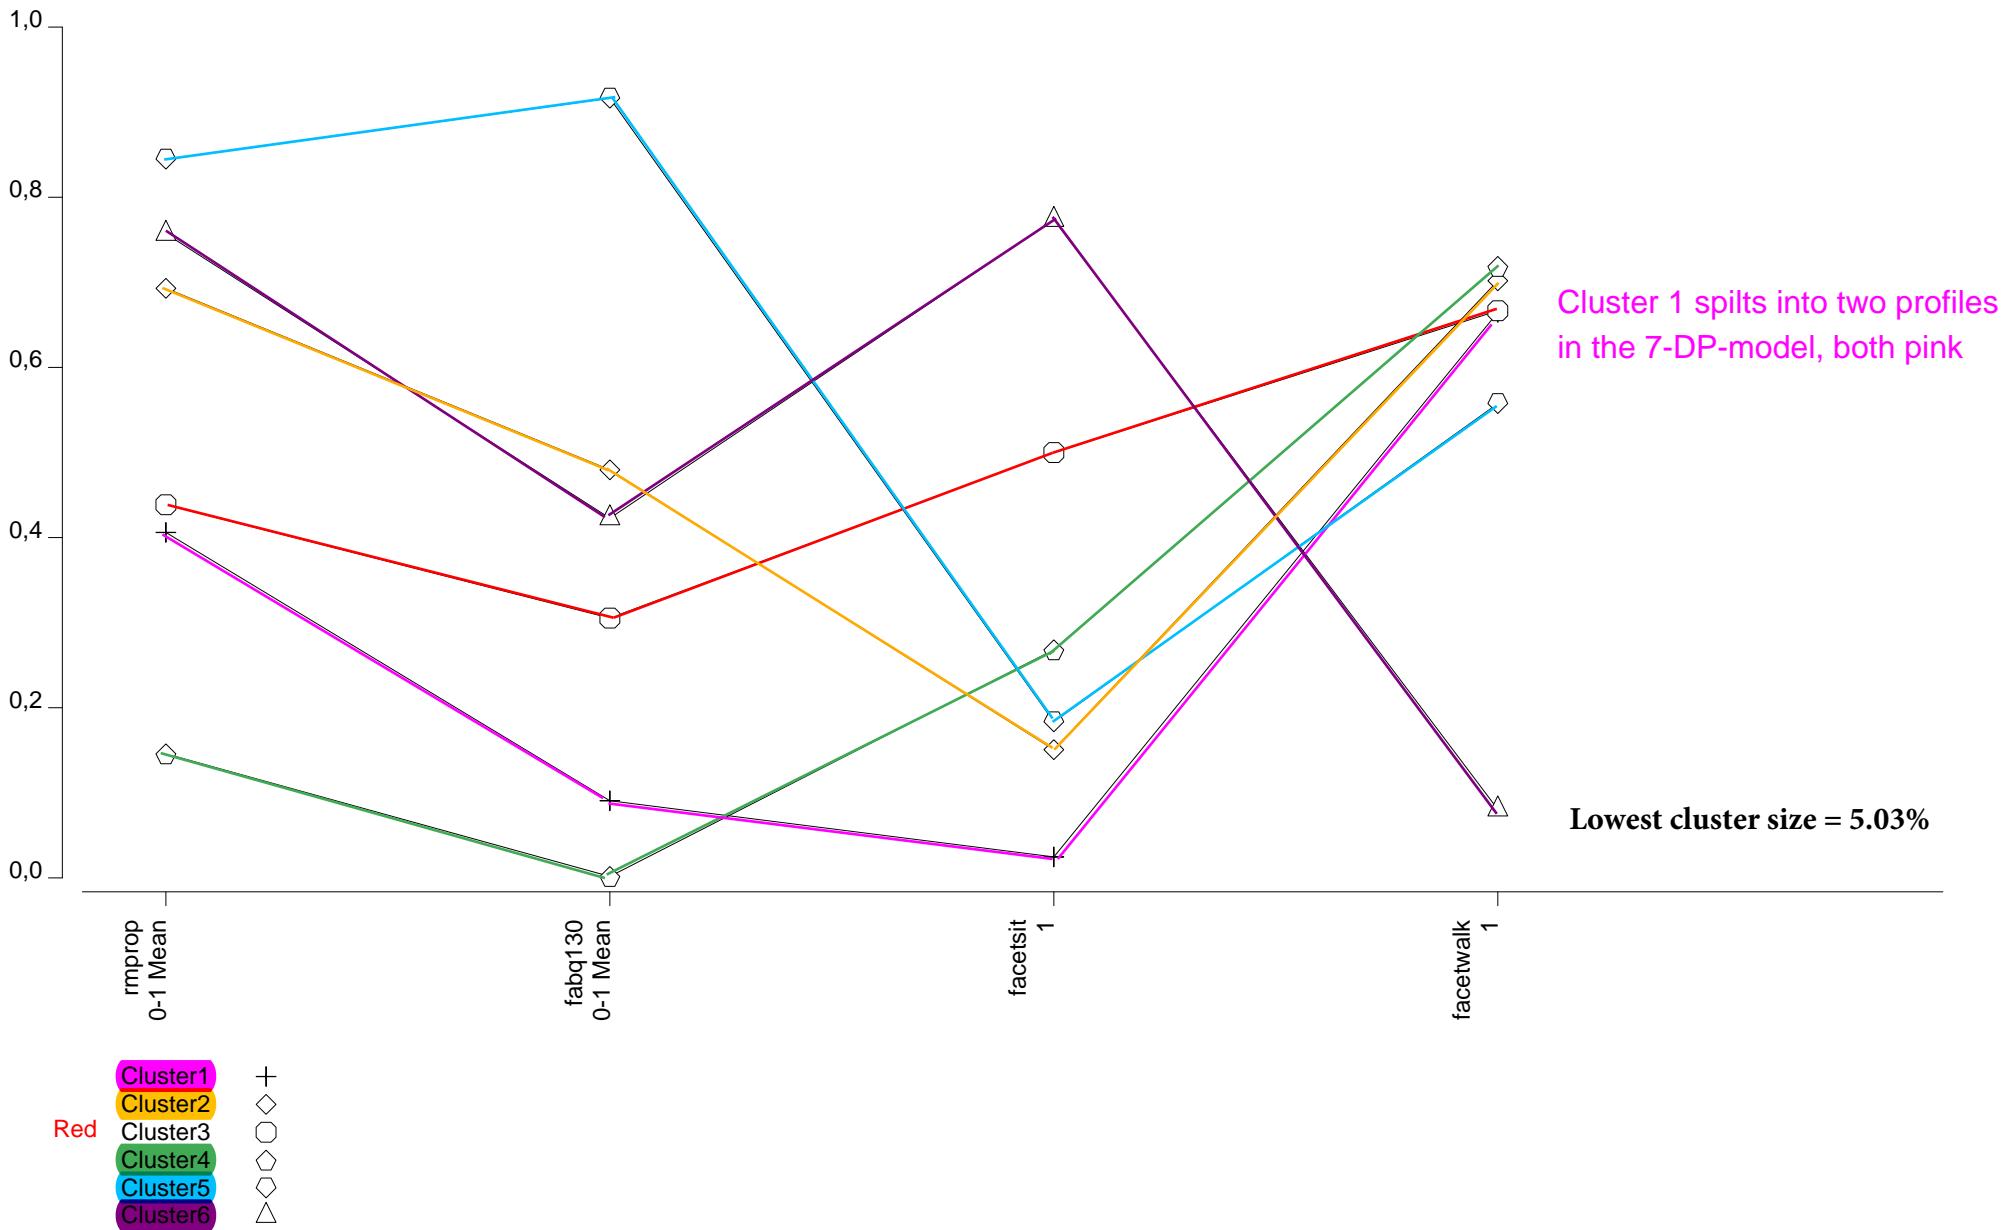

Cluster 1: Moderate activity limitation, ok to work despite pain, prefer to walk
Cluster 2: fairly high activity limitation, cannot work, prefer to walk
Cluster 3: low activity limitation, can work, prefer to walk
Cluster 4: Fairly high activity limitation, cannot work, prefer to sit

Lowest cluster size = 11.12%

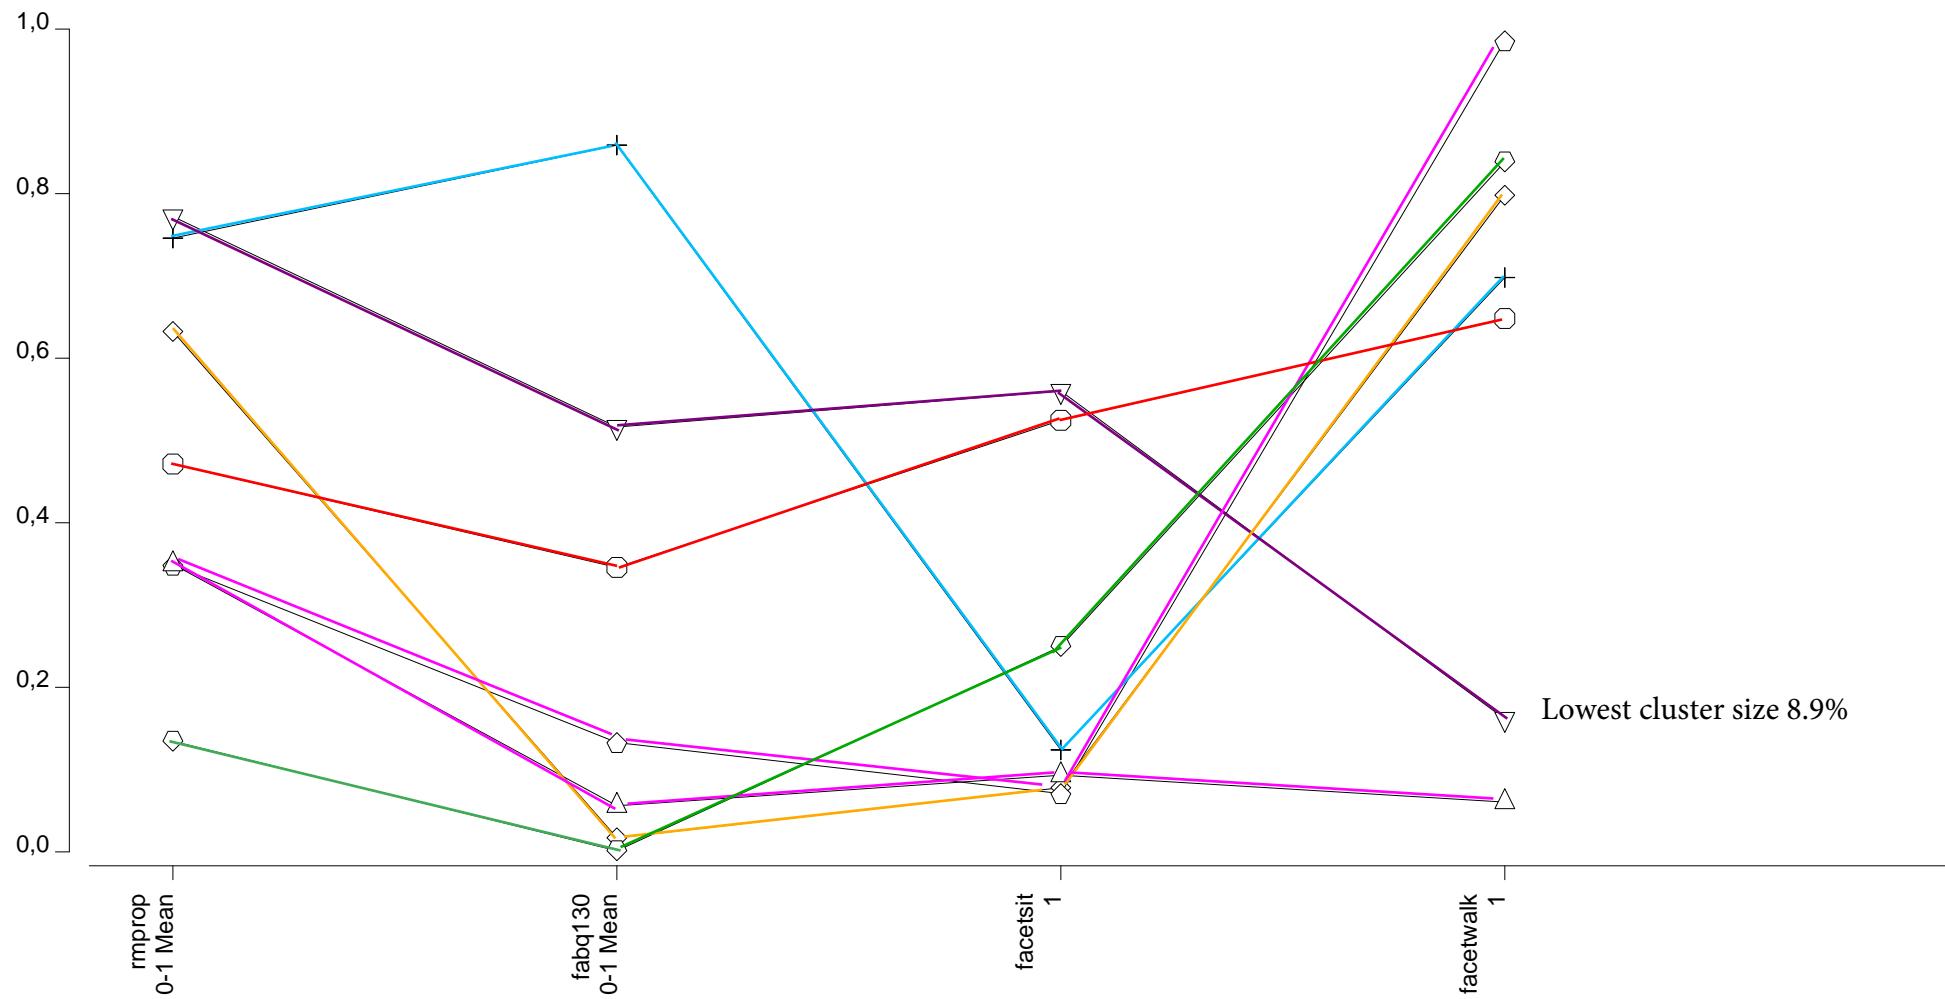

Activity domain, summary-score, 5-domain profiles

Activity domain, summary-score, 6-domain profiles

Activity domain, summary-score strategy, 7-domain profiles

- Red**
- Cluster 1: High act. limitation, fully agree cannot work, fully disagree 'best posture is to sit', agree 'best activity is to walk'
 - Cluster 2: High act. limitation, fully disagree cannot work, fully disagree 'best posture is to sit', agree 'best activity is to walk'
 - Cluster 3: 'The garbage bag': moderate act.limitation, don't know if cannot work and if 'best posture is to sit', agree 'best activity is to walk'
 - Cluster 4: Low act. limitation, fully disagree cannot work, fully disagree 'best posture is to sit', fully agree 'best activity is to walk'
 - Cluster 5: Very low act.limitation, fully disagree cannot work, fully disagree best posture to sit, fully agree on 'best activity is to walk'
 - Cluster 6: Low act. limitation, fully disagree cannot work, fully disagree 'best posture is to sit', fully disagree 'best activity is to walk'
 - Cluster 7: High act. limitation, don't know if cannot work or 'best posture to sit', fully disagree on 'best activity is to walk'

Larger models tend to have cluster sizes <5% and only differ quantitatively.

Profile in numbers - 5DP

The first row of numbers shows how large each cluster is. The body of the table contains (marginal) conditional probabilities that show how the clusters are related to the Nominal or Ordinal indicator variables. These probabilities sum to 1 within each cluster (column). For indicators specified as Continuous, the body of the table contains means instead of probabilities. For indicators specified as Ordinal, means are displayed in addition to the conditional probabilities

Loadings

The quantities reported under Clusters are simply correlations, representing the square root of the corresponding 'R2' or communality of the associated indicator.

Correlations: These are standardized values for the loadings reported in the Loadings output. They represent correlations between the indicators and factors.

Participation domain – summary-score strategy

Profile-plots: Results with 2 to 8 domain profiles based on the following variables:

Bfbe0	Physical load at work: 1=sitting, 2=sitting and walking, 3=light physical load, 4=heavy physical load
Dlsy0	Days with sick leave the last month (0, 1-5, 6-31)
Fabqw	Sum-score representing the following items from the Fear Avoidance Beliefs Questionnaire: 6,7,9,10,11,12,15 FABQ6: My pain was caused by my work or by an accident at work (0=disagree, 1=don't know, 2=agree) FABQ7: My work aggravated my pain (0=disagree, 1=don't know, 2=agree) FABQ9: My work is too heavy for me (0=disagree, 1=don't know, 2=agree) FABQ10: My work makes or would make my pain worse (0=disagree, 1=don't know, 2=agree) FABQ11: My work might harm my back (0=disagree, 3= don't know, 6=agree) FABQ12: I should not do my normal work with my present pain (0=disagree, 3= don't know, 6=agree) FABQ15: I do not think that I will be back to my normal work within 3 months (0=disagree, 3= don't know, 6=agree)

AMN's suggestion on final model: 5 domain profiles (clusters)

Cluster 1: Low physical work load (Sitting and walking at work) and very few fear avoidance beliefs in relation to work

Cluster 2: Moderate physical work load (sitting, walking and light physical load) and few fear avoidance beliefs in relation to work

Cluster 3: High physical work load (sits, walks and often light-heavy physical work load) and moderate fear avoidance beliefs in relation to work

Cluster 4: Very high physical work load (often heavy physical work load) and high fear avoidance beliefs in relation to work

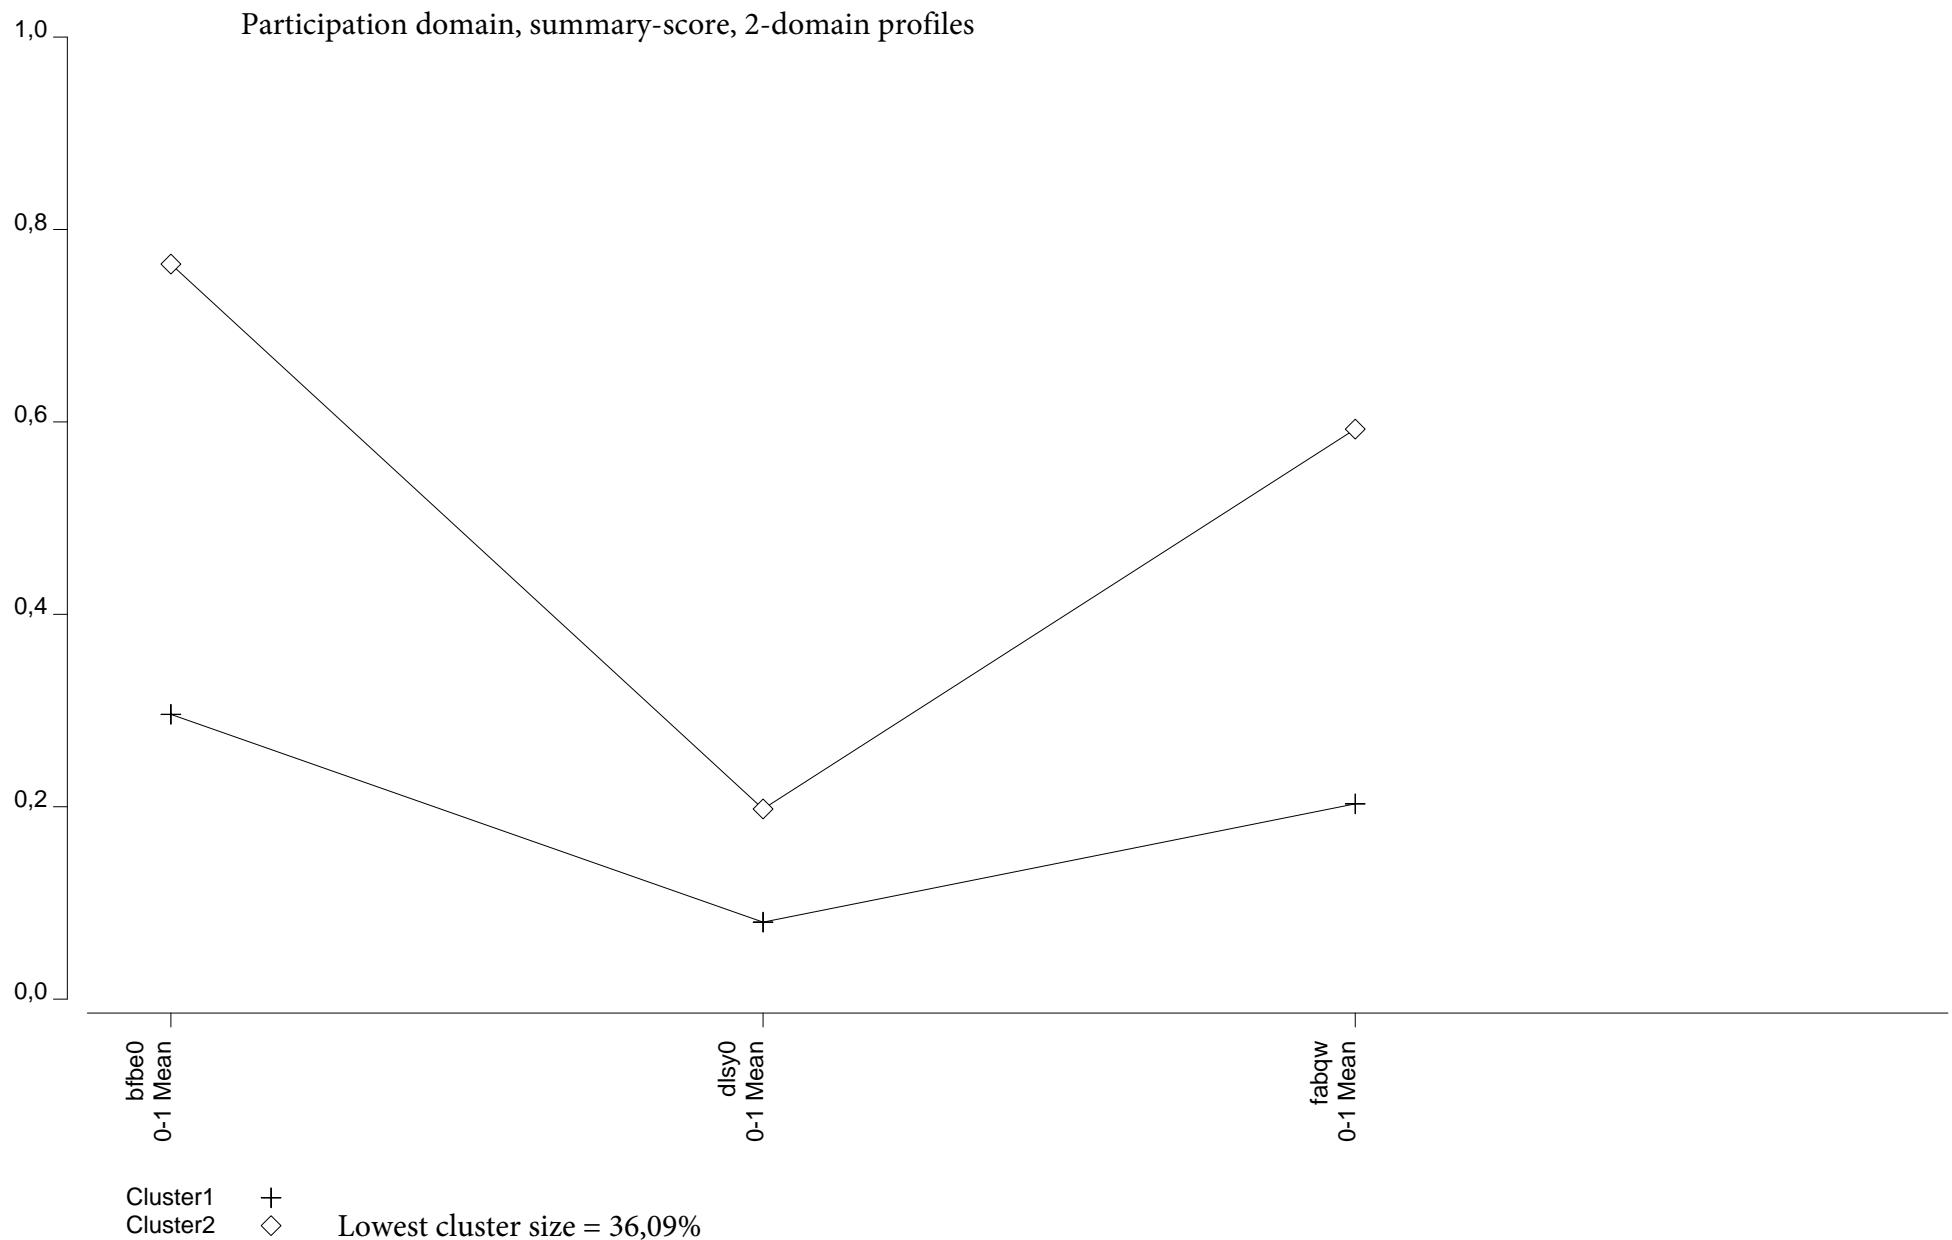

Cluster 5: Very low physical work load (sitting) and few fear avoidance beliefs

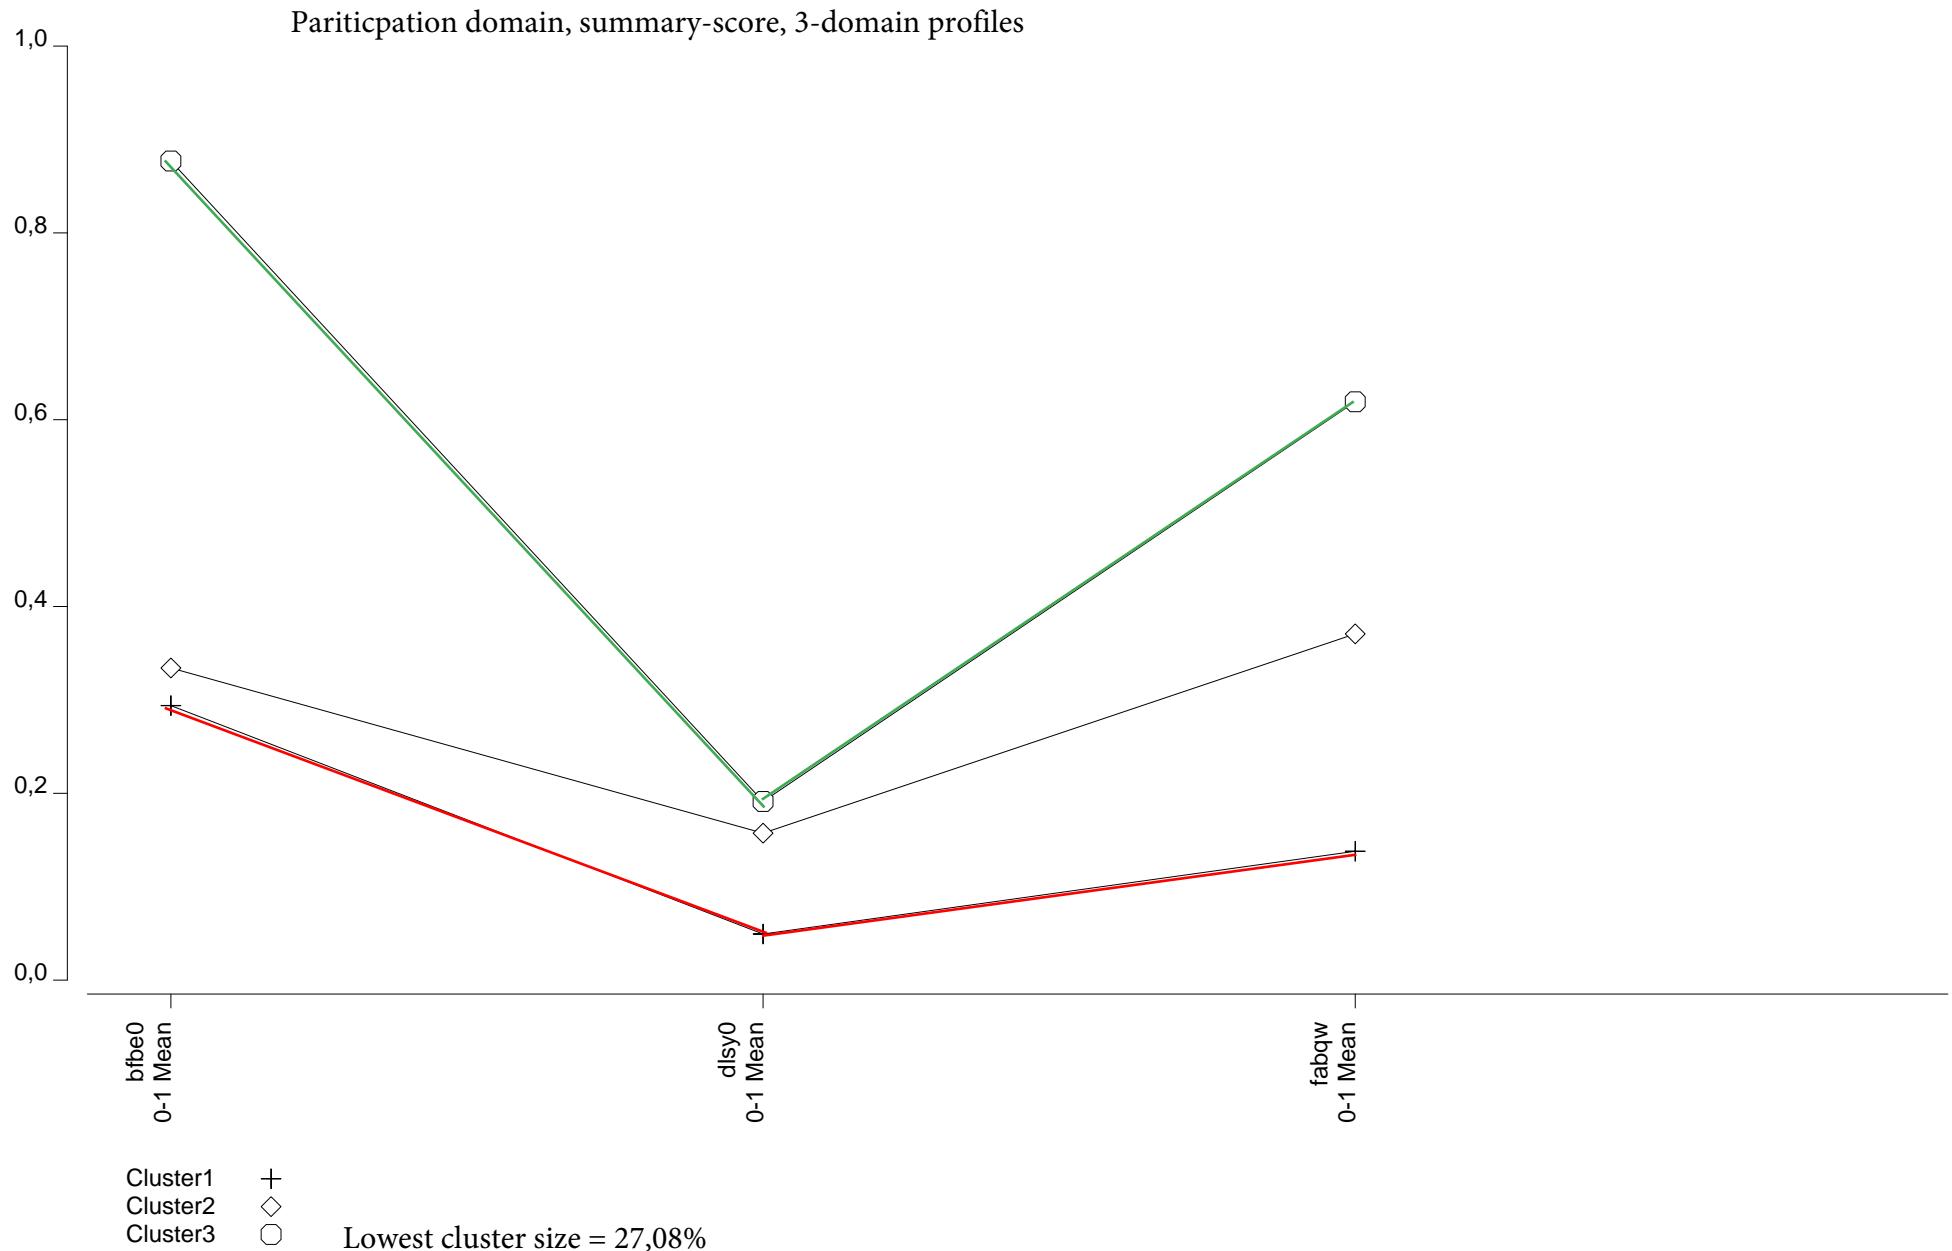

Facts:

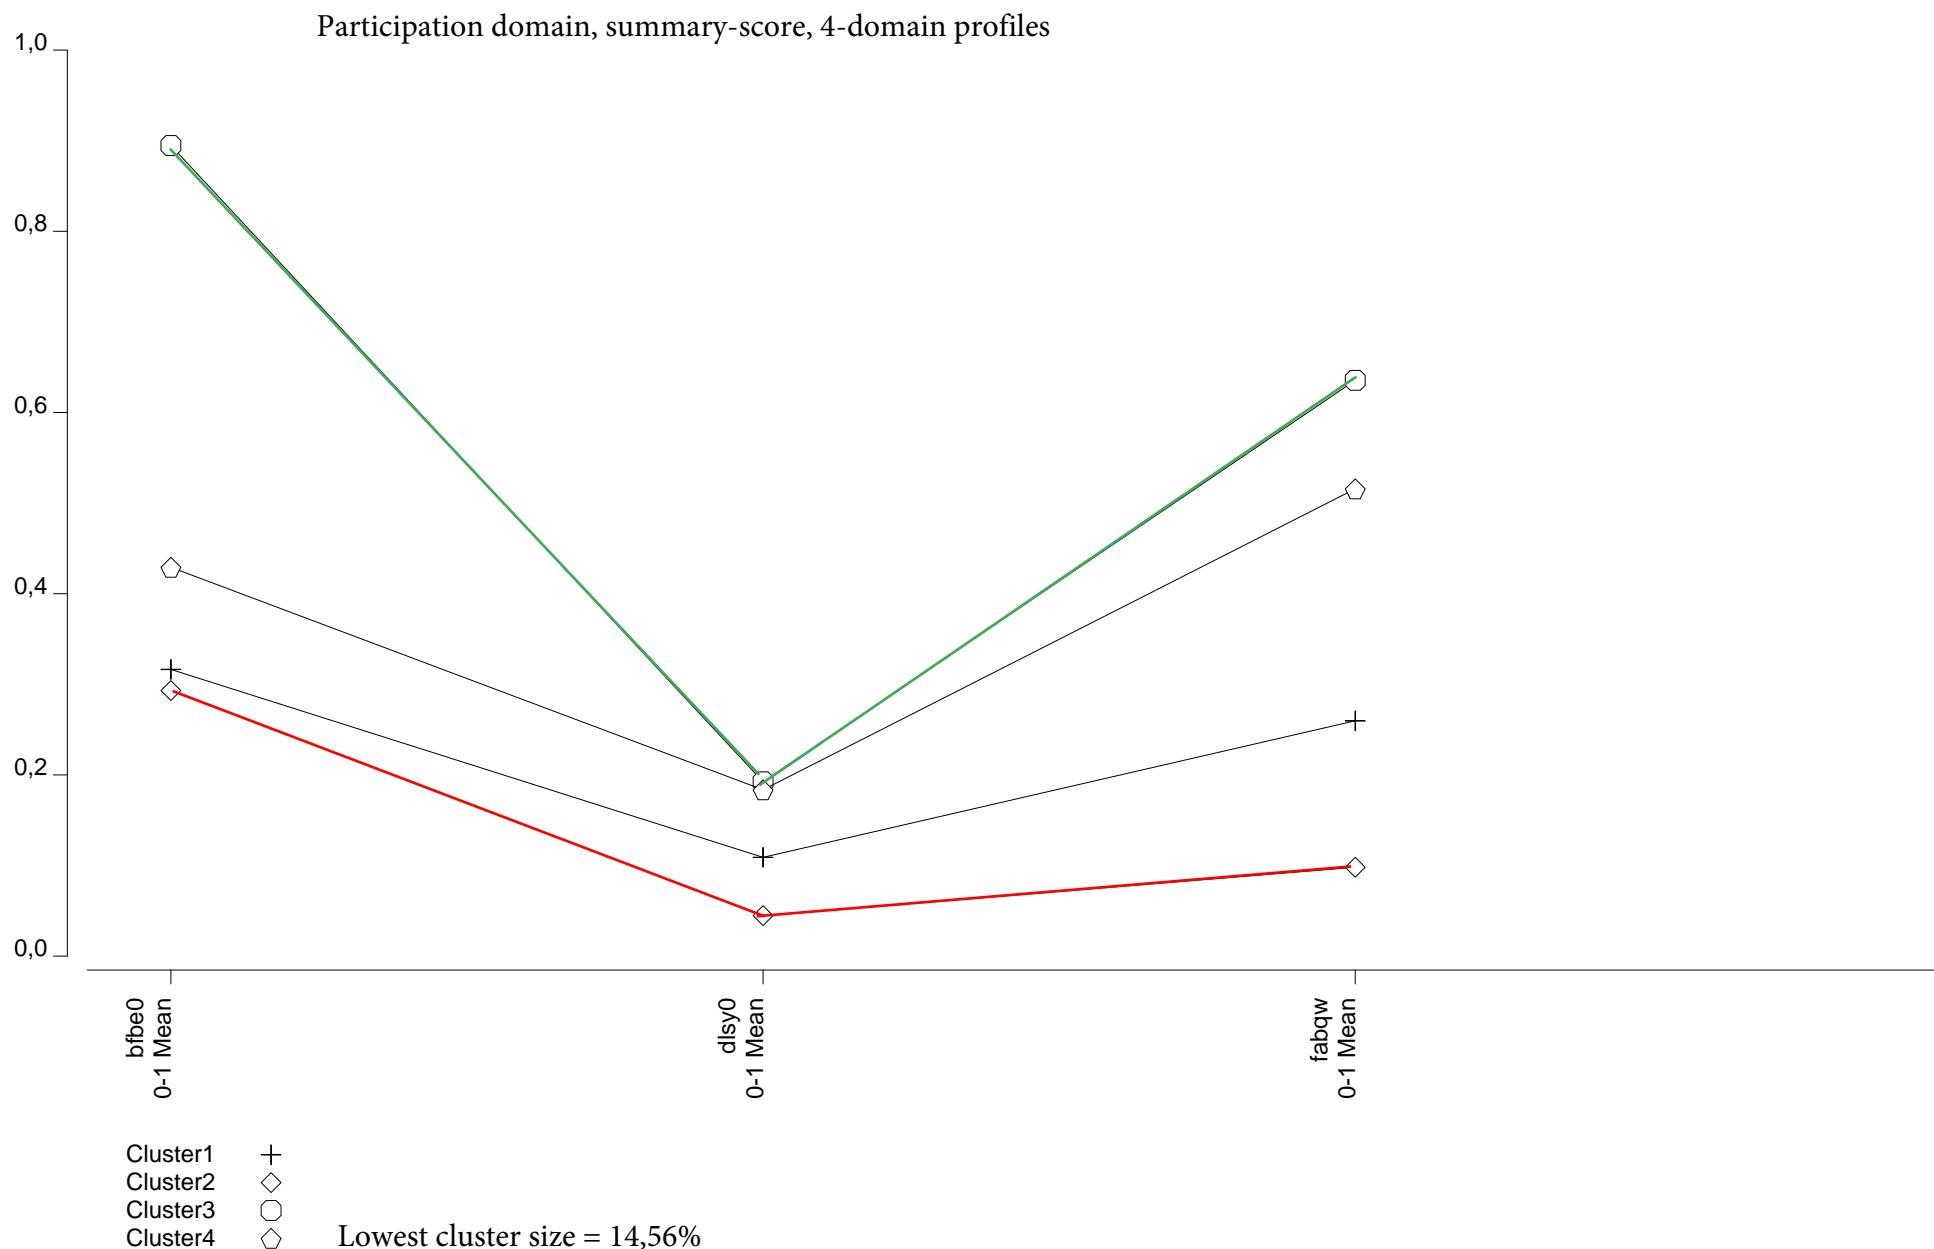

Lowest cluster size = 10.35%

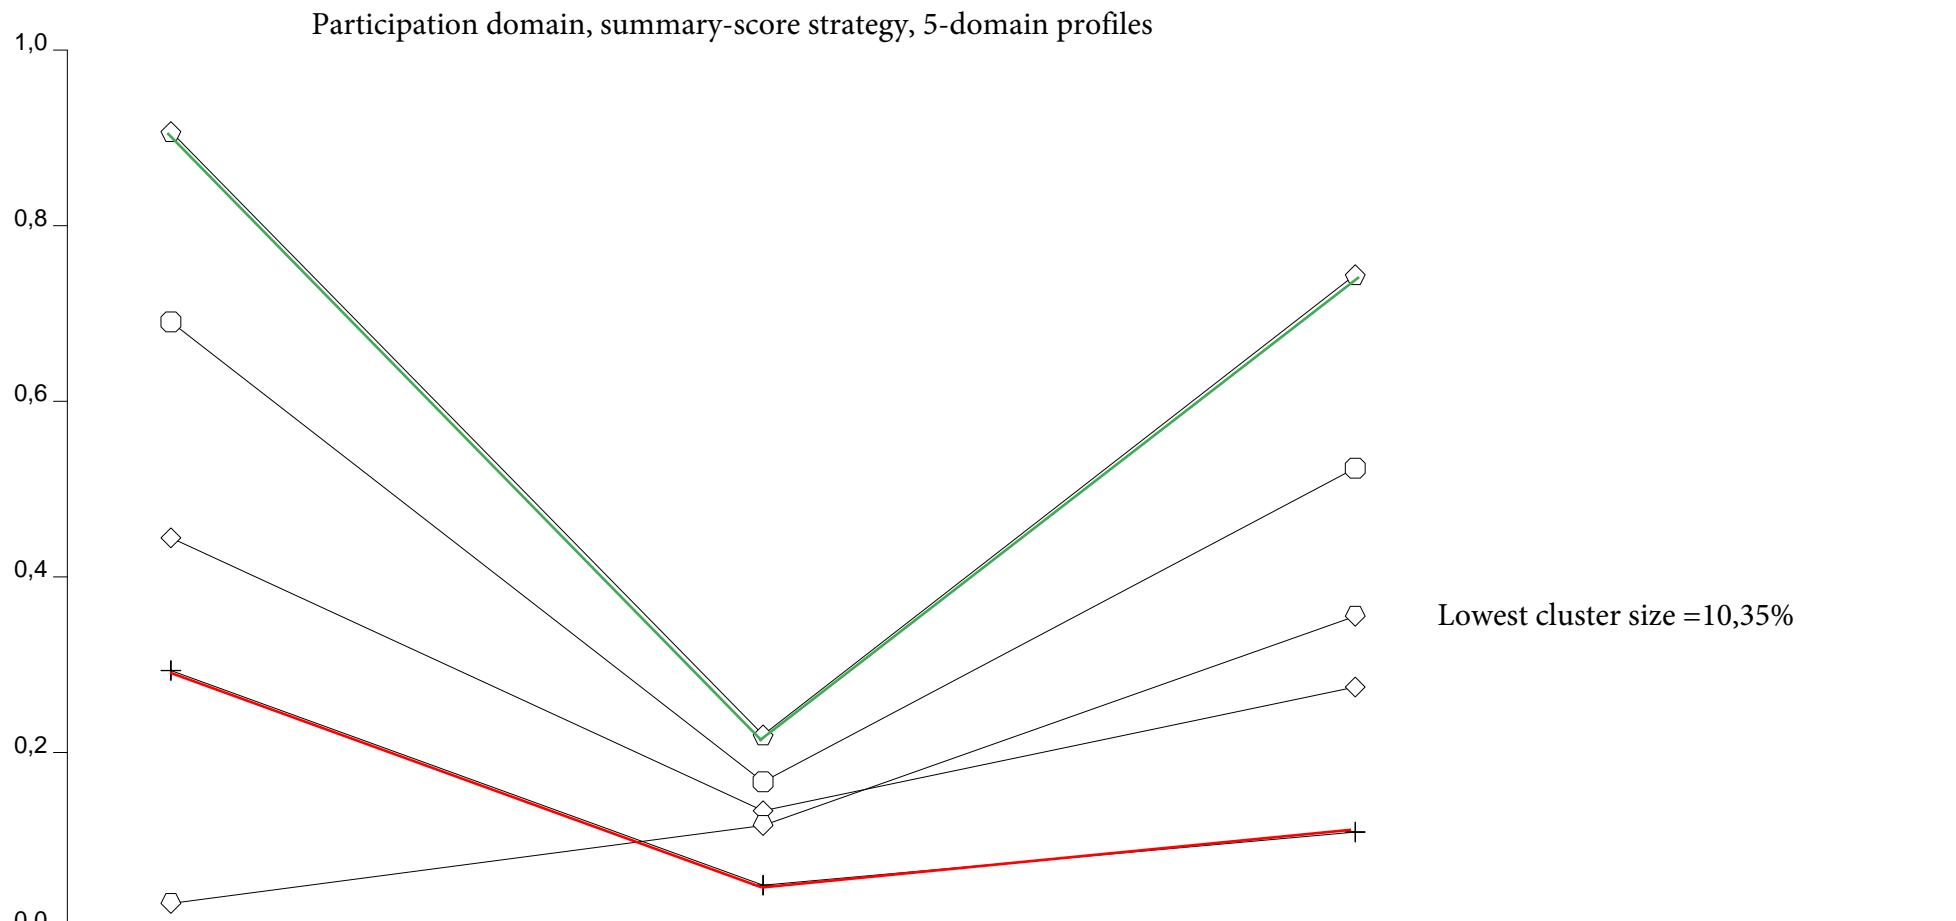

BIC was the same each time in 7 out of 10 rounds

Adding more clusters does not seem to change the 'quantitative presentation' – the more heavy workload the higher fear avoidance beliefs

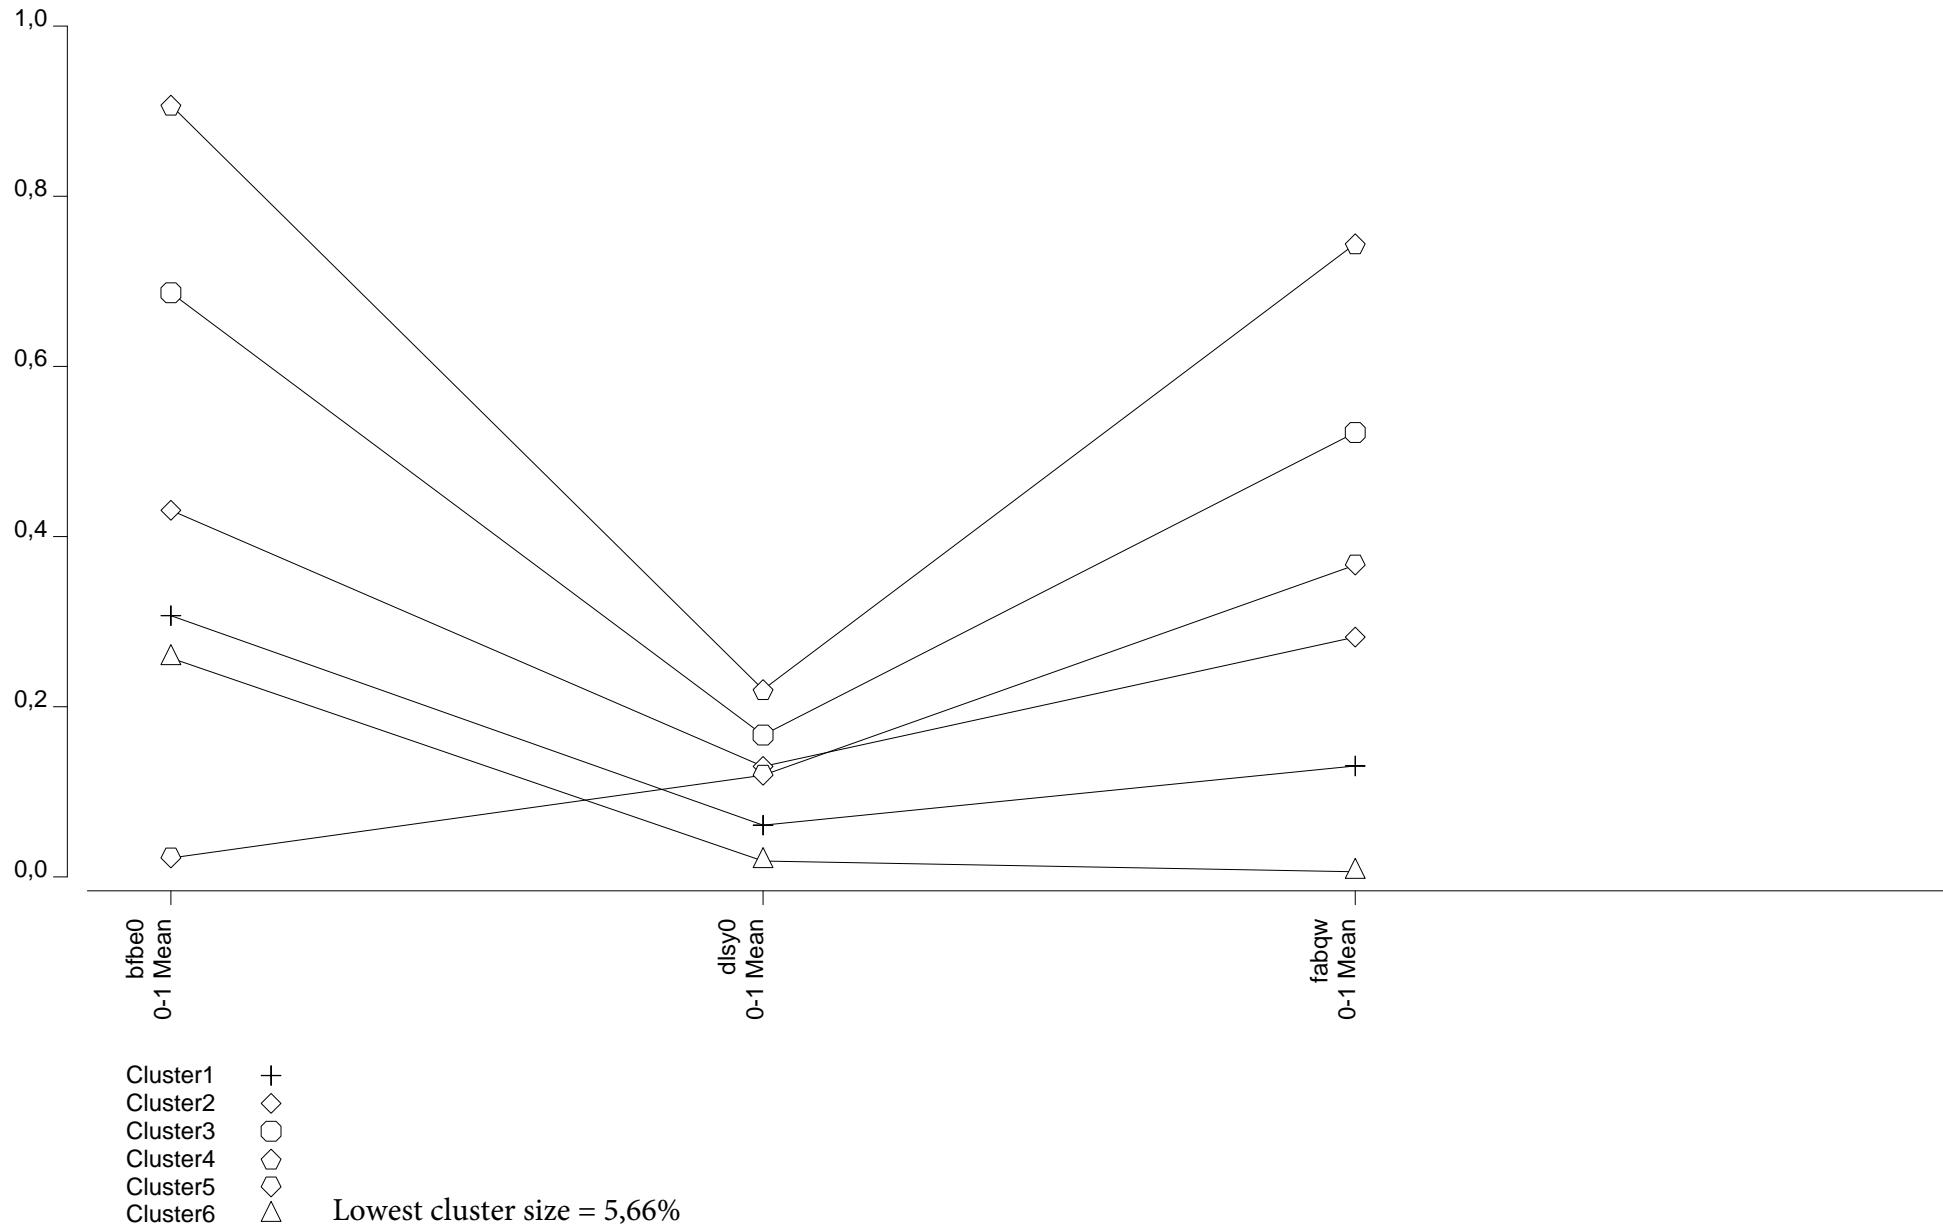

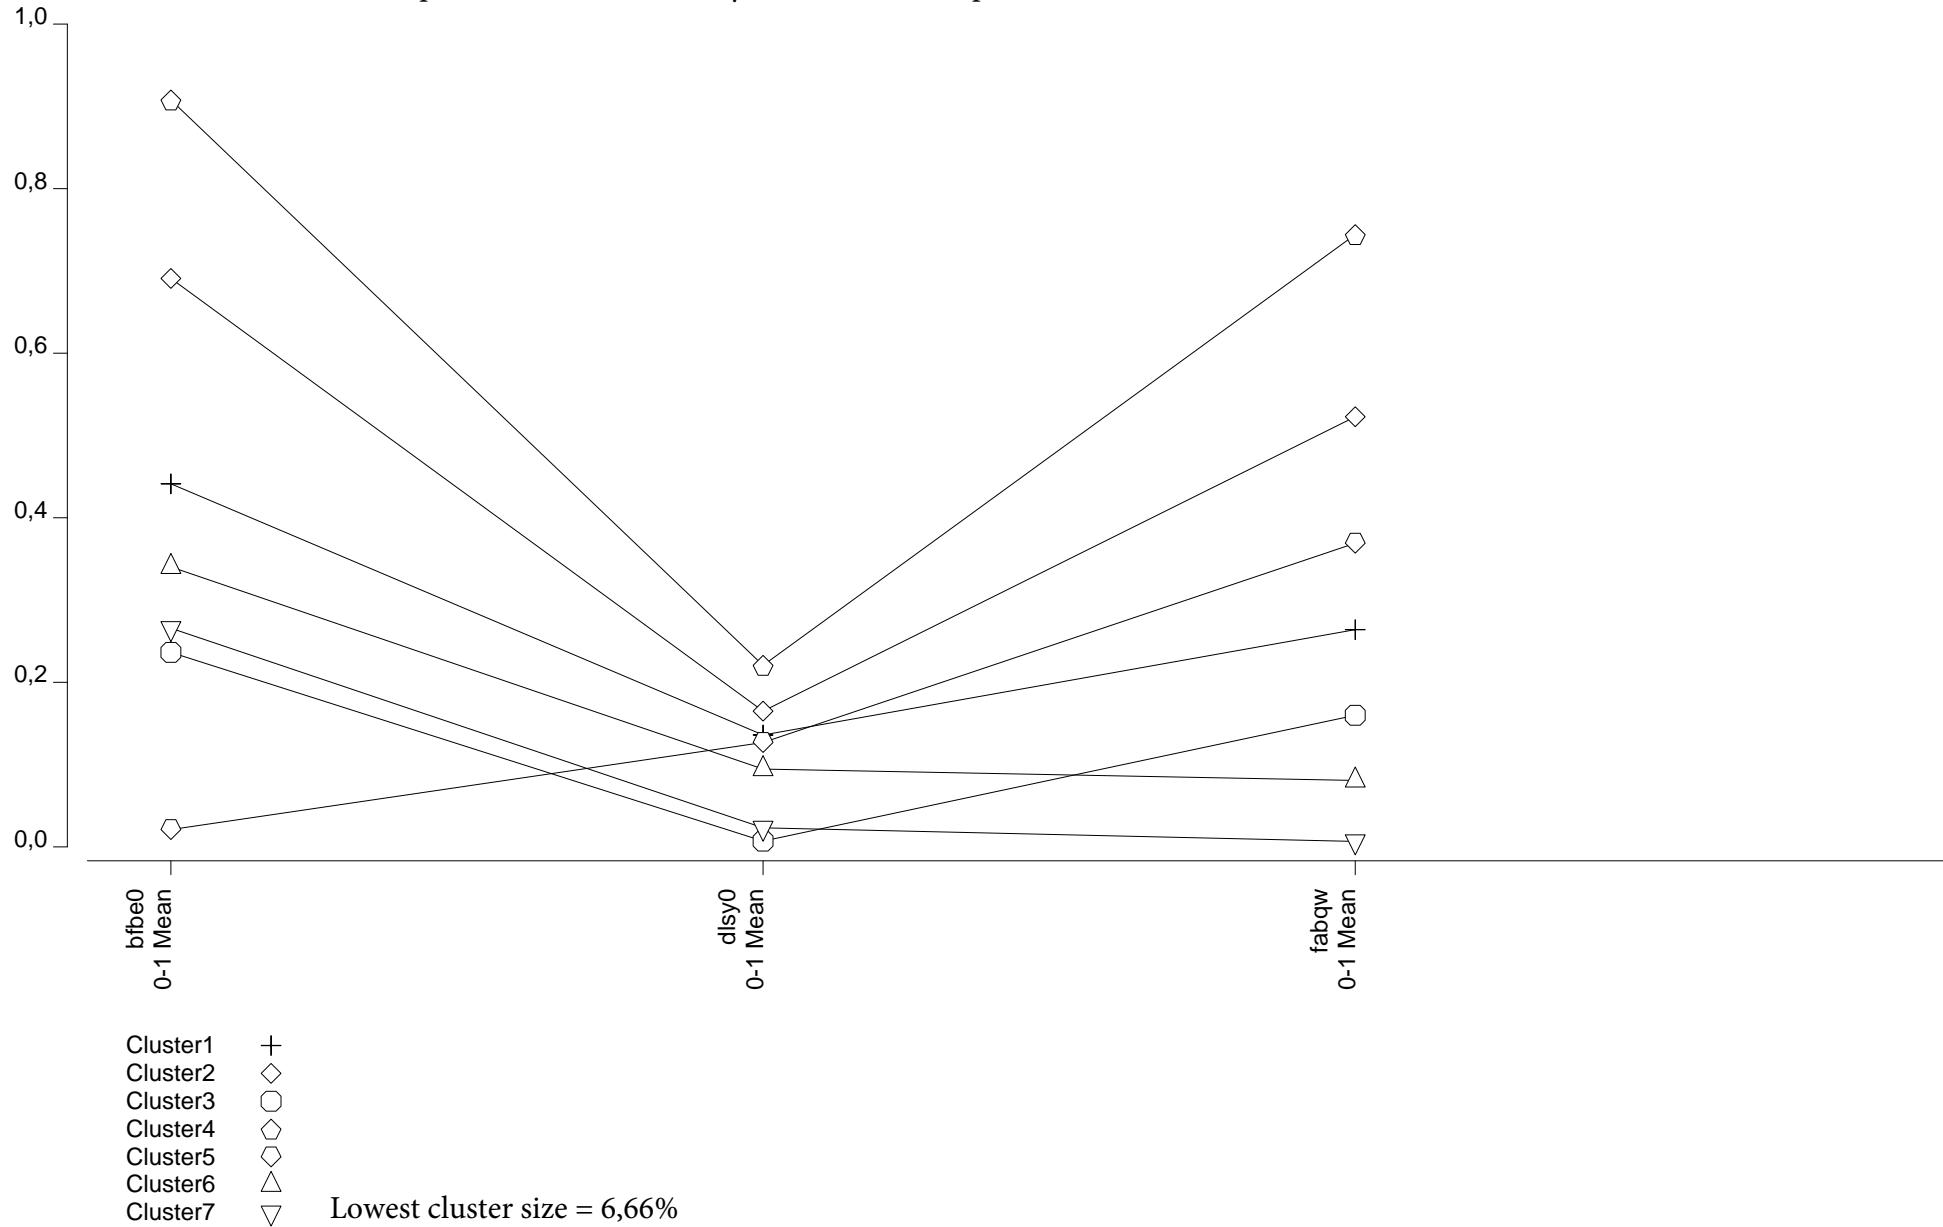

Cluster1 +
Cluster2 ◇
Cluster3 ○
Cluster4 ○
Cluster5 ◇

- Cluster 1: Low physical work load (Sitting and walking at work) and very few fear avoidance beliefs in relation to work
- Cluster 2: Moderate physical work load (sitting, walking and light physical load) and few fear avoidance beliefs in relation to work
- Cluster 3: High physical work load (sits, walks and often light-heavy physical work load) and moderate fear avoidance beliefs in relation to work
- Cluster 4: Very high physical work load (often heavy physical work load) and high fear avoidance beliefs in relation to work
- Cluster 5: Very low physical work load (sitting) and few fear avoidance beliefs

Loadings

The quantities reported under Clusters are simply correlations, representing the square root of the corresponding 'R2' or communality of the associated indicator.

Correlations: These are standardised values for the loadings reported in the Loadings output. They represent correlations between the indicators and factors.
