

Supplementary 1. Comparison of group-level GLM results from the model-driven analyses with uncorrected t -thresholds. Study 1 compares HC1 and FM1 results. Study 2 compares HC2 and FM2 results. Voxels that surpassed the uncorrected t -threshold of ± 1.70 for Study 1 and ± 1.71 for Study 2 are indicated in color, based on the color bars that represent t -scores adjacent to the slices. The corrected t -threshold for significance was ± 5.41 for Study 1, and ± 5.61 for Study 2. The diagram on the right shows the location of each selected slice within the brain. Slice 39 is blue. Slice 45 is red. Slice 65 is green.
