

Supplementary material

Supplementary Figures

Supplementary Figure 1: Representations of some of the differentially expressed proteins between samples from five different grades of SARS-CoV-2-infected patients. The normalized quantitative values of individual proteins across all sample groups are depicted as box plots, which were generated using the Qlucore Omics Explorer version 3.7 (Lund, Sweden) (<https://qlucore.com>).

Supplementary Figure 2: Comparative analyses of the canonical pathways and toxicity function of the different pairwise analyses of COVID-19 patients showing higher gene expression changes between severe and asymptomatic COVID-19 pairs than between mild or moderate and asymptomatic disease pairs. The figure was generated using the Ingenuity pathway Analysis (www.qiagen.com)

Supplementary Figure 3 A: The disease annotations of some of the 193 protein expression signatures among the different grades of SARS-CoV-2 infections with certain organs involved, including kidney, lung, and liver.

Some of the implicated proteins are shown in pink. Some of these proteins act as growth factors, peptidases, transporters, and transmembrane receptors.

Supplementary Fig. 3 B-C: The cellular processes, disease implications, and functional annotations of some of the 193 protein expression signatures among the different grades of SARS-CoV-2 infections.

The cellular processes include activation of antigen-presenting cells, receptor-mediated endocytosis, and complement pathway. Some of these processes eventually affect the host immune system, resulting in different clinical manifestations of COVID-19, such as coagulation, inflammatory response, hemostasis, and complement activation. The figure was generated using the Ingenuity pathway Analysis (www.qiagen.com)

Supplementary Tables

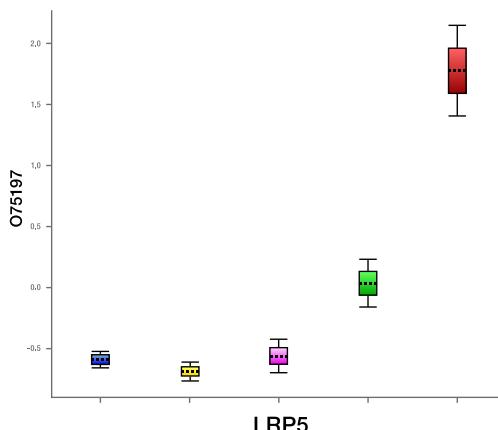

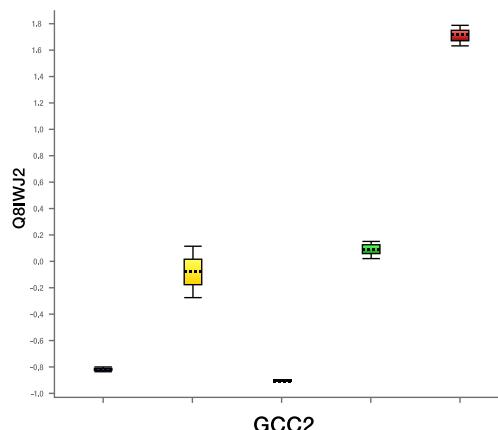

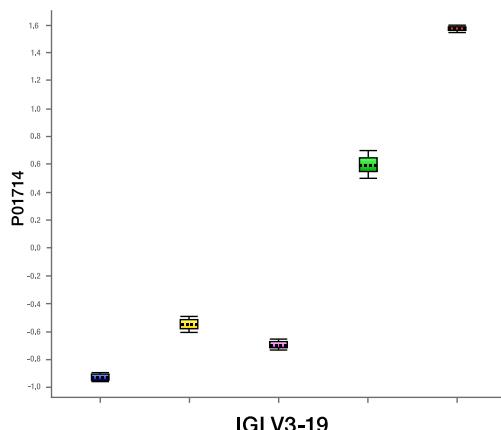

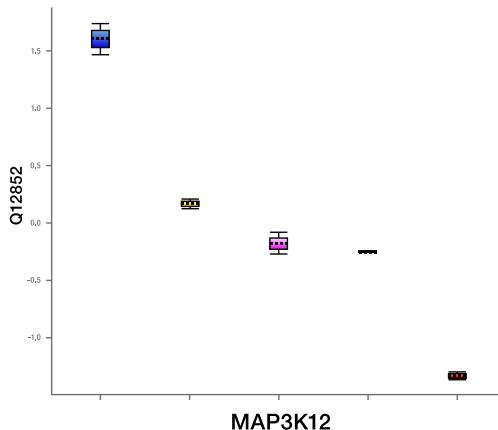

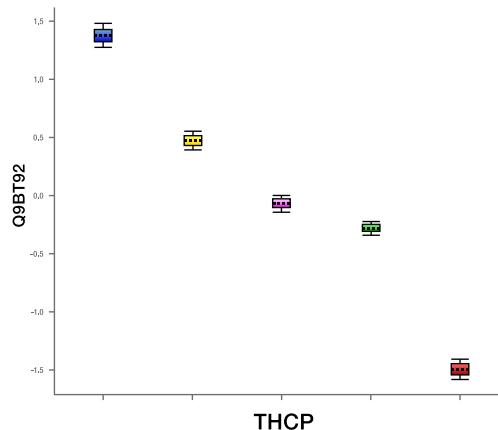

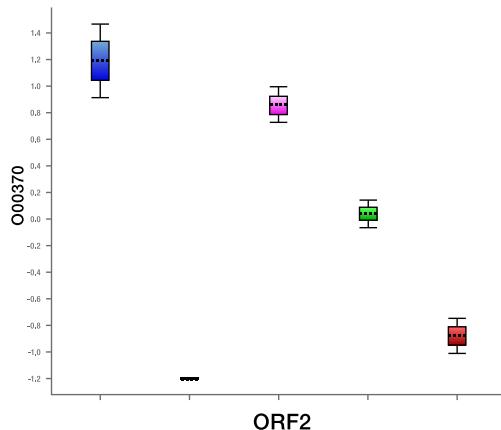

Supplementary Table S1: List of the 193 differentially expressed proteins between samples from five different grades of COVID-19 patients. (Highlighted in bold are some of the proteins that were previously identified by Messner et al. (12)).

Supplementary Table S2: List of the 91 differentially expressed proteins between samples from MERS-CoV patients with different disease severity and samples from control subjects.

Supplementary Table S3: Functional and cellular processes of the 49 overlapping proteins between 193 and 91 differentially expressed proteins in COVID-19 and MERS-CoV, respectively.

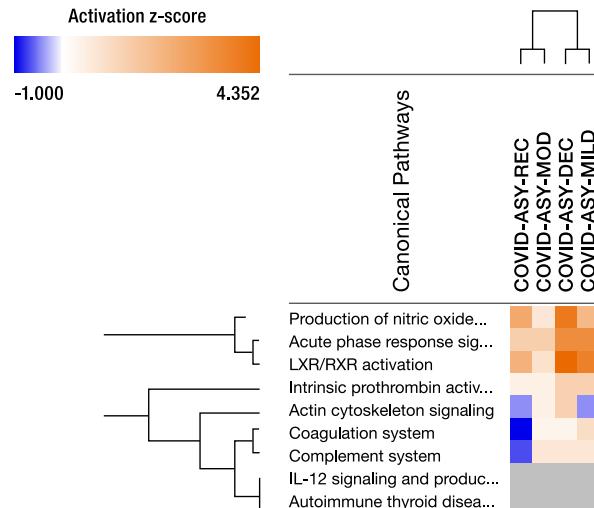

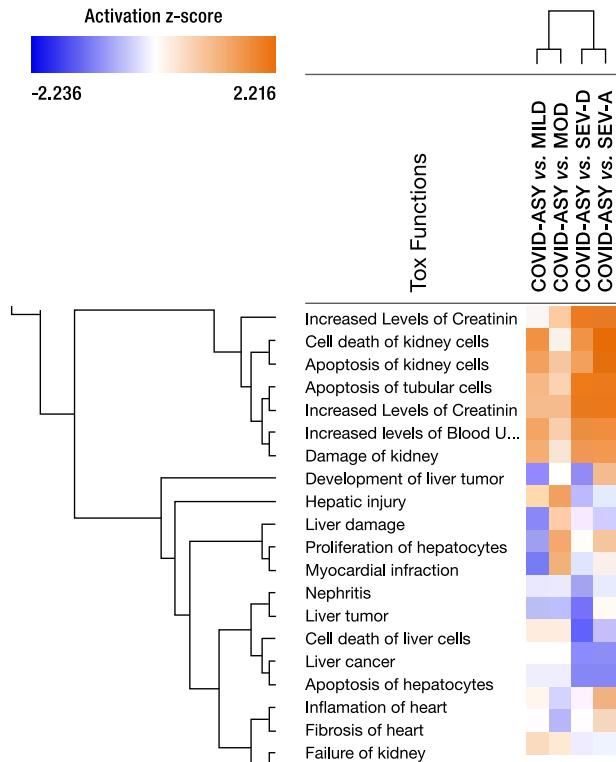

Supplementary Table S4: List of the 49 overlapping proteins between 193 and 91 differentially expressed proteins in COVID-19 and MERS-CoV respectively with their expressions shown among the CODID-19 samples. (Highlighted in bold are some of the proteins that have also been previously identified by Messner et al (12)).

Supplementary Figure 1: Representations of some of the differentially expressed proteins between samples from five different grades of SARS-CoV-2-infected patients. The normalized quantitative values of individual proteins across all sample groups are depicted as box plots, which were generated using the Qlucore Omics Explorer version 3.7 (Lund, Sweden) (<https://qlucore.com>).
