Abstract: Synthesis of silver nanoparticles (AgNPs) with biological properties is of vast significance in the development of scientifically valuable products. In the present study, we describe simple, unprecedented, nontoxic, eco-friendly, green synthesis of AgNPs using an Indian traditional farming formulating agent, panchakavya. Silver nitrate (1 mM) solution was mixed with panchakavya filtrate for the synthesis of AgNPs. The nanometallic dispersion was characterized by surface plasmon absorbance measuring 430 nm. Transmission electron microscopy showed the morphology and size of the AgNPs. Scanning electron microscopy—energy-dispersive spectroscopy and X-ray diffraction analysis confirmed the presence of AgNPs. Fourier transform infrared spectroscopy analysis revealed that proteins in the panchakavya were involved in the reduction and capping of AgNPs. In addition, we studied the antibacterial activity of synthesized AgNPs. The synthesized AgNPs (1–4 mM) extensively reduced the growth rate of antibiotic-resistant bacteria such as Aeromonas sp., Acinetobacter sp., and Citrobacter sp., according to the increasing concentration of AgNPs.

Keywords: green synthesis, panchakavya, antibacterial, environment, nanoparticles

Introduction

Synthesis of nanoparticles (NPs) has received considerable attention in recent years due to the wide range of NP applications in different scientific fields, such as medicine, biotechnology, chemistry, physics, catalysis, electronics, and materials science.¹,² The metallic NPs exhibit numerous physical and chemical properties that are not observed either in the individual molecules or in the bulk materials.³ Among the metallic NPs, silver NPs (AgNPs) in particular are known for their versatile biological applications in the fields of medicine and biotechnology.⁴,⁵ AgNPs can be synthesized by physical and chemical methods.⁶,⁻¹¹ The chemical synthesis of AgNPs may lead to the presence of some toxic chemicals adsorbed on the surface that may have adverse effects in its application and also the chemical used in the synthesis may pollute the environment.⁵

Biological materials have the potential to reduce the metal ions into metal NPs. Biosynthesis of AgNPs gained considerable attention in the past decade. Moreover, it has been proposed as a less toxic, cost-effective, environmentally friendly alternative to chemical and physical methods. Accordingly, AgNPs have been synthesized using microorganisms,¹²⁻¹⁵ plant extracts,¹⁶ milk.¹⁷ The proteins present in the biological materials are involved in the reduction and stabilization of NPs.¹⁸

Livestock plays a vital role in the income of Indian farmers and livestock products have a significant place in the livelihoods of farmers. For sustainable
agricultural management, Indian farmers have developed several traditional formulations based on their knowledge accumulated through generations of experience. Panchakavya is one such excellent formulation, consisting of five products from cows: milk, curd, ghee, urine, and dung.19 Principally, panchakavya is a mixture of microorganisms, including *Azospirillum* sp., *Azatobacter* sp., *Pseudomonas* sp., and many other beneficial organisms. Moreover, it also contains proteins, lipids, carbohydrates, micronutrients, and antioxidants.19 However, there has been no report to date on the synthesis of AgNPs using panchakavya.

The antibiotic-resistant *Citrobacter* sp. and *Aeromonas* sp. are Enterobacteraeae-family clinical pathogens that cause a wide range of infections, including urinary tract infections, neonatal sepsis, meningitis, bloodstream infections, and pneumonia.20–22 *Acinetobacter* sp., which belongs to the Gram-negative Gammaproteobacteria class, causes a wide spectrum of infections that include pneumonia, bacteremia, meningitis, urinary tract infection, and wound infection.22,23 The high mortality rate associated with these microbial infections may be due in part to ineffective empirical antibiotic therapy. These microorganisms are commonly resistant to extended-spectrum antibiotics.23 However, the populations of antibiotic-resistant microorganisms are continuously increasing, and their control is a major challenge for scientists and researchers.24

The wastes discharged from pharmaceutical industries, hospitals, and research laboratories contain different groups of antibiotics and other pollutants. The presence of antibiotics in the ecosystem induces the development of an antibiotic resistance mechanism in microbial communities. Hence, the synthesis of AgNPs and their antimicrobial properties are emerging as areas of great interest among researchers. AgNPs have been widely studied for their antibacterial,25 antifungal,17 and antiviral26,27 properties due to their large surface area. Accordingly, the objectives of the present study were 1) to synthesize AgNPs using panchakavya extract; 2) characterization of synthesized AgNPs; and 3) evaluation of the antibacterial activity of biologically synthesized AgNPs.

**Materials and methods**

**Panchakavya**

Panchakavya was procured from Sakthi Vermicomposting farm, Madurai, Tamil Nadu, India. The principal constituents of panchakavya are presented in Table 1. The mixture of panchakavya was filtered through Whatman No 1 filter paper followed by 0.2 µm membrane filter, and the filtrate was used for the synthesis of AgNPs.

**Synthesis of AgNPs**

AgNO₃ was purchased from Sigma-Aldrich (St Louis, MO, USA), and the synthesis procedure was carried out according to the methods of Lee et al.17 Briefly, 4 mL of panchakavya was mixed with 96 mL of 1 mM AgNO₃ solution, and the resulting milky-white mixture was incubated for 8 hours in a rotary shaker (180 rpm) at room temperature. Reduction of Ag⁺ ions to Ag was monitored by change in color of the reaction mixture from milky white to dark brown.

Characterization techniques

The synthesis of AgNPs was characterized preliminarily by scanning the absorption maxima of the mixture at wavelengths between 300–700 nm on a UV-1800 ultraviolet-visible (UV-Vis) spectrophotometer (Shimadzu, Kyoto, Japan). The characterization of the synthesized AgNPs was conducted with a Rigaku X-ray diffractometer (Tokyo, Japan), operated at 2θ from 30° to 80° at 0.041°/minute with a time constant of 2 seconds. AgNP synthesis and the elemental composition were further confirmed by scanning electron microscopy–energy dispersive spectroscopy ([SEM–EDS] JEOL-64000; JEOL, Tokyo, Japan). The surface morphology, crystalline nature, and size of the synthesized AgNPs were examined using high-resolution transmission electron microscopy ([TEM] JEM-2010; JEOL) at an accelerating voltage of 200 kV. The spectra of the AgNPs were obtained by Fourier transform infrared spectroscopy ([FTIR] PerkinElmer, Waltham, MA, USA) in the diffuse reflectance mode at a resolution of 4 cm⁻¹ with KBr pellets.

Antibacterial activity

The antibiotic-resistant bacterial strains Citrobacter sp., Acinetobacter sp., and Aeromonas sp. were allowed to grow in 100 mL of Luria-Bertani broth supplemented with synthesized AgNPs ranging from 1–4 mM. The growth of the bacterial strains was indexed by measuring the optical density (at λ=600 nm) at regular intervals (0–48 hours) using the Shimadzu UV-1800 spectrophotometer. The growth curve was plotted between optical density and time.

Results and discussion

The reduction of AgNO₃ using biological materials is the most widely practiced method for the green synthesis of AgNPs in colloidal form. After 8 hours’ incubation at room
temperature, the milky-white reaction mixture turned into a yellowish brown color. The appearance of yellowish brown color is the indication of AgNO$_3$ reduction. The biomolecules present in panchakavya may be involved in the reduction of AgNO$_3$ to AgNPs. A recent report of AgNPs synthesis has established the significant role of proteins in reduction of AgNO$_3$, and Litvin et al$^{28}$ reported the formation of AgNPs using humic substance. In the present study, panchakavya was mixed in an aqueous solution of silver ion complex and the reduction of pure Ag$^+$ ions to Ag$^0$ was monitored by measuring the UV-Vis spectrum of the reaction media. Figure 1 shows that the UV-Vis spectra of the silver surface

plasmon resonance band occurs near 430 nm. The results are consistent with a previous report. The samples were subjected to TEM, X-ray diffraction (XRD) and SEM–EDS to confirm the presence of Ag. TEM images of the biosynthesized AgNPs showed that the particles were spherical in shape with an average size of 20 to 100 nm (Figure 2). To further validate the AgNPs, the samples were analyzed in SEM–EDS and the results are shown in Figure 3. The results
show strong silver signals at 3 keV. The EDS quantitative analysis showed the presence of silver (100%) without any contaminants. FTIR is an important tool for the identification of functional groups and interactions between molecules. The bands observed at 3,416 and 2,920 cm⁻¹ were assigned to the C-H stretching vibrations of the primary and secondary amines, respectively. The sharp absorption peaks at 1,629 and 1,046 cm⁻¹ (Figure 4) could be of N-H stretching in primary and secondary amines and amides. The crystalline nature of the synthesized AgNPs was investigated by XRD and the corresponding XRD diffractogram is shown in Figure 5. The XRD peaks at 46.1°, 54.55°, 67.74°, and 76.84° correspond to 111, 200, 142, 220, and 311 planes for silver (JCPDS card number 04-0783).5,17 Bio-synthesized AgNPs were studied for antibacterial activity against antibiotic-resistant bacteria, namely, Citrobacter sp., Acinetobacter sp., and Aeromonas sp. The bacterial growth in different concentrations (1–4 mM) of AgNPs was determined and plotted as a function of time for 0–48 hours at regular intervals (Figure 6). The results indicate that 4 mM of AgNPs effectively inhibited the bacterial growth. In general, the growth rate of the bacterial population was decreased according to the increasing concentration of AgNPs. The results are consistent with studies reporting the antibacterial activity of AgNPs.30–32

Conclusion
We used nontoxic, eco-friendly panchakavya for the consistent and rapid synthesis of AgNPs. The synthesized particles were circular in shape and the elemental composition confirmed the presence of silver without any contamination. The prepared AgNPs had significant antibacterial activity against antibiotic-resistant bacteria. Application of AgNPs based on this conclusion may lead to diverse applications in the fields of science and technology.
