A very rare case of HPV-53-related cervical cancer, in a 79-year-old woman with a previous history of negative Pap cytology [corrigendum]

On page 686, Figure 3 originally contained one panel and incorrect heading and notes. The authors have provided a new Figure 3 and a new legend.

**Notes:** Anyplex II HPV28 detection assay simultaneously detects 28 HPV genotypes. β-globin gene is used as a positive endogen control to identify processed specimens containing substances that may interfere with PCR amplification. Thyroid tissue was used as an external HPV-negative control.

**Abbreviations:**
- CIN2+: lesion adjacent to invasive neoplasia
- HPV-negative
- HPV: human papillomavirus
- Tm: melting temperature
- HPV: human papillomavirus
- CIN2+: lesion adjacent to invasive neoplasia
- HPV-negative
- HPV: human papillomavirus

**Abbreviations:**
- CIN2+: cervical intraepithelial neoplasia grade 2-or-worse
- –d(RFU)/dT: change in rate of fluorescence units against temperature
- IC: internal control
- Tm: melting temperature
- HPV: human papillomavirus

**Figure 3**

Real-time PCR assay performed on tissues (invasive cervical cancer, CIN2+: lesion adjacent to invasive neoplasia, metastatic lymph nodes, non-metastatic lymph nodes, and thyroid), and on liquid-based urinary samples.

**Notes:** Anyplex II HPV28 detection assay simultaneously detects 28 HPV genotypes. β-globin gene is used as a positive endogen control to identify processed specimens containing substances that may interfere with PCR amplification. Thyroid tissue was used as an external HPV-negative control. (A) Invasive cervical cancer showing positive result for HPV-53. (B) CIN2+: lesion, in which positive results for HPVs 16, 35, 39, 40, 53, 54, 59, 61, 68 and 82, have been found. (C) Metastatic lymph nodes showing HPV-53 positive result. (D) Non-metastatic lymph nodes testing as HPV-negative. (E) Thyroid tissue testing as HPV-negative. (F) Urinary samples in which HPV-53 has been found. (G) Melting curve of HPV-53 control included in the PC3 mix of set B demonstrating the melting curve shape and Tm. Melting profile of samples, in which HPV-53 has been found, showed a Tm of 76.5°C.
