

Nomenclature of drug-induced pityriasis rosea-like rashes

Antonio AT Chuh

Dear editor

I read with admiration an article published in your prestigious journal on the rare adverse effects of clozapine (CLZ).¹

I write to address a specific issue in this article. In the second paragraph of the section “Dermatological adverse effects”, it was stated that a 54-year-old patient with schizophrenia treated for 28 days with CLZ developed a generalized rash compatible with pityriasis rosea (skin rash that usually begins as one large circular or oval spot on your chest, abdomen, or back).

I wish to point out certain problems for coining pityriasis rosea (PR) as the diagnostic label in the patient concerned.

First, PR is a paraviral exanthem that might be associated with primary infections or endogenous reactivations of human herpesvirus-7, -6,^{2,3} or other viruses.^{4,5} The underlying immunopathogenesis of PR is likely to be entirely different from that in PR-like drug eruptions.⁶

Second, rashes with morphological and distributional resemblances to PR that may be caused by drugs are currently considered as a separate condition distinct from PR in ICD-10.⁷ Thus, we recommend a revision to “pityriasis rosea-like drug eruption” as the diagnostic label in the article.¹

Third, quoting the diagnostic label as “PR-like drug eruption” is compatible with the current diagnostic criteria^{8,9} and the modern classification¹⁰ of PR.

Fourth, it was stated that PR is “...skin rash that usually begins as one large circular or oval spot on your chest, abdomen, or back, ...”¹ This statement refers to PR in general and is incorrect as only about 30%–40% of patients with PR have identifiable herald patches.⁶ Moreover, it gives us no information on the morphology, distribution, and time sequence of rash for the 54-year-old patient with schizophrenia.

The characteristics of PR-like drug eruptions are 1) absence of the herald patch, 2) bright violet-red color of the rash with marked inflammation, 3) being more pruritic, 4) dominance of eosinophils in the skin infiltrate, and 5) eosinophilia in the peripheral blood.¹¹

From reading the article by De Fazio et al¹ the readers could get a false impression that PR-like drug eruptions usually begin as one larger circular or oval spot. The reverse is true – there is usually no herald patch for PR-like drug eruptions. It is thus not an issue of nomenclature per se – it might lead to confusions to readers and other investigators as to the clinical manifestations of PR-like drug eruptions.

Fifth, most recent articles coin the term “PR-like drug eruptions” rather than “PR” for drug-induced PR-like rashes.^{12–15} I advocate that this convention should be followed.

Finally, some patients with PR-like drug eruptions could have been recruited into clinical studies and trials (Villarama and Lansang, unpublished data, 2003).^{16,17} I recommend that such practices be discontinued.

Therefore, I hope that through this item of correspondence, the status of PR-like drug eruption can be rectified.

Otherwise, I am extremely impressed by the high quality of the article by De Fazio et al¹ and reading the article has been of immense educational value for me.

Dear editor

We thank Dr Chuh for his comments and all suggestions addressed at improving the quality of our paper.

According to our review, the discussion about dermatological effects of clozapine treatment was focused on the rare causes of "pityriasis rosea (PR)-like eruption" defined as "a common cutaneous adverse reaction related to many drugs".¹

Moreover, we considered it to be useful to underline that numerous recent studies in search for the etiology of

pityriasis rosea (PR) did not pinpoint a definite viral,²⁻⁴ other infectious,⁵ or other causes.⁶

Therefore, these clinical patterns are not all or nothing and appear with variable magnitudes of atypical PR rash.^{7,8} The case report we have described in the review refers to "a generalized rash 'compatible' with pityriasis rosea", or rather a "PR with atypical forms", and even though the issue could be described in detail, it was useful to include in the discussion what the latest literature has reported on this topic.
