Resistance training might have improved insulin resistance by attenuating sarcopenia

Dear editor

We read the valuable article of Oliveira et al entitled “Resistance training improves isokinetic strength and metabolic syndrome-related phenotypes in postmenopausal women” with interest. In their well-designed prospective study, the authors observed improvement in metabolic syndrome-related phenotypes after 12 weeks of resistance training. We have some comments that could facilitate interpretation of the results of this study.

Because muscle mass is an important target for glucose uptake, sarcopenia seems to be an emerging risk factor for insulin resistance in elderly individuals. Resistance training is among the most important measures to attenuate sarcopenia. Thus, we suggest that there may be a close relationship between improvement in muscle mass and reduction in insulin resistance in this study. At least some of the individuals in this study (90.3±24.1 Nm) seem to have sarcopenic muscle strength considering the muscle strength measurements of a sarcopenic obesity group (87.5±17.8 Nm) in a previous study from Brazil. After the resistance training intervention, the muscle strength of the study population (101.9±21.4 Nm) is similar to the non-sarcopenic obese group (96±23.4 Nm) in the previous study. Thus, transition from sarcopenia to normal muscle mass and functions is a rational explanation to the improvement in insulin resistance in this study. We suggest that the authors assess the relationship between delta-homeostatic model assessment-insulin resistance (delta-HOMA-IR) and delta-muscle strength. Furthermore, a multivariate regression analysis might also be performed to seek independent factors underlying improvement of insulin resistance (delta-HOMA-IR). These analyses may provide clinically relevant information.

Publish your work in this journal

Clinical Interventions in Aging is an international, peer-reviewed journal focusing on evidence-based reports on the value or lack thereof of treatments intended to prevent or delay the onset of maladaptive correlates of aging in human beings. This journal is indexed on PubMed Central, MedLine, CAS, Scopus and the Elsevier Bibliographic databases. The manuscript management system is completely online and includes a very quick and fair peer-review system, which is all easy to use. Visit http://www.dovepress.com/testimonials.php to read real quotes from published authors.
