Dearest editor

We thank the authors for their comments. In our Table 3, the odds ratio of adverse clinical outcomes for laparoscopic cholecystectomy patients with and without COPD was adjusted by all variables listed in Table 1, including age at surgery, gender, income, hospital level, and comorbidities.

We agreed that time period was long in our observation study and the management strategy, especially for COPD patients, has evolved and changed a lot. It is an inherent limitation in the long observational study.

Secondly, the information on intraoperative and postoperative respiratory management cannot be obtained from the database. The preoperative optimization strategy for risk reduction and postoperative patients care were relevant to individual physician performance. This is not only the characteristics of the national database but also real-world conditions.

In Taiwan, if hospitals are capable of performing laparoscopy, most of them also provide services of hemodialysis, mechanical ventilation, and intensive care unit.

We agreed that proper patient selection is crucial and is associated with outcome and prognosis.

International Journal of Chronic Obstructive Pulmonary Disease

Publish your work in this journal

The International Journal of COPD is an international, peer-reviewed journal of therapeutics and pharmacology focusing on concise rapid reporting of clinical studies and reviews in COPD. Special focus is given to the pathophysiological processes underlying the disease, intervention programs, patient focused education, and self management protocols. This journal is indexed on PubMed Central, Medline and CAS. The manuscript management system is completely online and includes a very quick and fair peer-review system, which is all easy to use.
