This article was published in the following Dove Press journal:
OncoTargets and Therapy

Purpose: Non-small cell lung cancer (NSCLC) is the first leading cause of cancer-related death globally. Long noncoding RNA KCNQ1 overlapping transcript 1 (KCNQ1OT1) was involved in the progression of multiple cancers by sponging target miRNA. We aimed to explore the pathological mechanism of KCNQ1OT1 in NSCLC progression.

Methods: The expression of KCNQ1OT1, miR-204-5p and autophagy-related gene 3 (ATG3) was measured by quantitative real-time polymerase chain reaction (qRT-PCR), 3-(4, 5-Dimethyl-2-thiazolyl)-2, 5-diphenyl-2-H-tetrazolium bromide (MTT) assay and flow cytometry assay were conducted for the detection of cell proliferation and apoptosis, respectively. Western blot assay was performed to examine the protein levels of B-cell lymphoma-2 (BCL-2), BCL2-Associated X (Bax), cleaved caspase-3, cleaved caspase-9 and LC3Ⅰ/Ⅱ. The interaction between miR-204-5p and KCNQ1OT1 or ATG3 was validated by dual-luciferase reporter system and RNA immunoprecipitation (RIP) assay. Murine xenograft assay was conducted to explore the function of KCNQ1OT1 in vivo. Immunohistochemistry (IHC) staining assay was used for the analysis of Ki67-positive cell percentage.

Results: The expression of KCNQ1OT1 and ATG3 was up-regulated whereas miR-204-5p was down-regulated in NSCLC tumors and cells. MiR-204-5p was inversely correlated with KCNQ1OT1 or ATG3. In addition, KCNQ1OT1 knockdown facilitated apoptosis, inhibited autophagy and proliferation of NSCLC cells in vitro and blocked tumor growth in vivo. However, the miR-204-5p inhibitor reversed the effects. More importantly, ATG3 was a target gene of miR-204-5p and ATG3 overexpression restored the effect of miR-204-5p on NSCLC cell progression.

Conclusion: KCNQ1OT1 promotes cell proliferation and autophagy and inhibits cell apoptosis via regulating miR-204-5p/ATG3 axis, providing a promising target for NSCLC therapy.

Keywords: KCNQ1OT1, miR-204-5p, ATG3, NSCLC

Introduction

Non-small cell lung cancer (NSCLC) which accounts for more than 80% of lung cancer is the first leading cause of cancer-related death globally.1,2 Despite advanced treatment strategies, including surgical resection, chemotherapy, radiotherapy, immunotherapy and combined therapy, have palliated the symptoms, the 5-year overall survival rate is still less than 20% in patients with NSCLC.3–5 In addition, chemo-resistance and high metastasis of NSCLC vitiated the therapy outcomes.5 Therefore, it is urgently needed to elucidate the physiological and pathological mechanism of NSCLC.
Long non-coding RNAs (lncRNAs) are fundamental modulators of cell cycle, proliferation, migration, differentiation, invasion, metastasis, apoptosis, inflammation and autophagy in multiple cancers.\(^7\)\(^-\)\(^9\) LncRNA KCNQ1 overlapping transcript 1 (KCNQ1OT1), mapped in human KCNQ1 locus with a length of 91 kb, plays essential roles in tumor proliferation, metabolism, epithelial–mesenchymal transition (EMT) and growth via functioning as competing endogenous RNA (ceRNA).\(^10\)\(^-\)\(^11\) KCNQ1OT1 mainly acts as an oncogene in different cancers. For instance, KCNQ1OT1 facilitated proliferation, migration and invasion of cholangiocarcinoma cells by interacting with miR-140-5p.\(^12\) Besides, KCNQ1OT1 was reported to improve chemoresistance of oxaliplatin against hepatocellular carcinoma by up-regulating ABCC1 via sponging miR-7-5p.\(^13\) Though a previous study has demonstrated that KCNQ1OT1 could be an oncogene in NSCLC,\(^14\) the molecular mechanism of KCNQ1OT1 in NSCLC remains obscure.

MicroRNAs (miRNAs) are evolutionarily conserved small non-coding RNAs with 19–23 nucleotides in length.\(^15\)\(^,\)\(^16\) Despite without protein coding capacity, miRNAs are widely involved in the regulation of gene expression at the post-transcriptional level by complementarily binding with messenger RNAs (mRNAs).\(^15\)\(^-\)\(^19\) Ectopic expression of miRNA is closely associated with tumorigenesis and development.\(^20\) As a tumor suppressor, miR-204-5p is a pivotal regulator in multiple cancers. For example, miR-204-5p suppressed cell invasion and metastasis by targeting forkhead box C1 in laryngeal squamous cell carcinoma.\(^21\) Similarly, miR-204-5p attenuated proliferation, migration, invasion and metastasis of hepatocellular carcinoma and oral squamous cell carcinoma though repressing CXCR4 and SIRT1 expression, respectively.\(^22\)\(^,\)\(^23\) Autophagy-related gene 3 (ATG3) could be targeted by several miRNAs to participate in the regulation of NSCLC.\(^24\)\(^,\)\(^25\) However, whether miR-204-5p can target ATG3 in NSCLC requires deep investigation.

In the present study, we attempted to investigate the underlying mechanism of the KCNQ1OT1/miR-204-5p/ATG3 axis in NSCLC cell progression. All the results indicated that KCNQ1OT1 promotes proliferation and autophagy while suppresses apoptosis by regulating the miR-204-5p/ATG3 axis. This study might provide promising biomarkers for the diagnosis and treatment of NSCLC.

**Materials and Methods**

**Tissue Samples**

Fresh NSCLC tumor tissues and the corresponding normal tissues were obtained from 35 NSCLC patients recruited from The First Affiliated Hospital of Zhengzhou University. The patients had not received preoperative treatment. All NSCLC patients have signed written informed consents and the experiment protocols were approved by the Ethics Committee of The First Affiliated Hospital of Zhengzhou University.

**Cell Transfection**

NSCLC cell lines HCC827, H1299, A549, H460 and human bronchial epithelial cell BEAS-2B were purchased from the American Type Culture Collection (ATCC, Manassas, VA, USA). All the cells were cultured in Dulbecco’s modified Eagle’s medium (DMEM; Gibco, Carlsbad, CA, USA) supplemented with 10% fetal bovine serum (FBS; Gibco) and 0.05% penicillin/streptomycin (Gibco). Small hairpin RNA (shRNA) targeting KCNQ1OT1 (sh-KCNQ1OT1), shRNA negative control (sh-NC), pcDNA, and pcDNA-ATG3 overexpression vector (ATG3) were synthesized by GenePharma (Shanghai, China). The miRNA mimics (miR-204-5p), miR-204-5p inhibitor (anti-miR-204-5p), miRNA negative control (miR-NC) and miRNA negative control inhibitor (anti-miR-NC) were purchased from RIBOBIO (Guangzhou, China). The synthetic oligonucleotides or plasmids were transfected in A549 and H460 cells using Lipofectamine 2000 (Invitrogen, Carlsbad, CA, USA).

**Quantitative Real-Time Polymerase Chain Reaction (qRT-PCR)**

NSCLC tissues and cells were incubated with TRizol reagent (Invitrogen) to extract total RNA. The cDNA for KCNQ1OT1, miR-204-5p and ATG3 was synthesized by All-in-One™ First-Strand cDNA Synthesis Kit (FulenGen, Guangzhou, China). Then, qRT-PCR was performed using SYBR green (Applied Biosystems, Foster City, CA, USA) following the standard procedures. The primers for KCNQ1OT1, miR-204-5p, ATG3, GAPDH and U6 were listed as follows: KCNQ1OT1 (Forward, 5'-TTGGT AGGATTTTGTGAGG-3'; Reverse, 5'-CAACCTTCCC CTACTACC-3'); miR-204-5p (Forward, 5'-CGAAGTT CCTTGTGT CATCCT-3'; Reverse, 5'-GTGCAAGGGTCCG AGTTATTC-3'); ATG3 (Forward, 5'-GCAAACAAGAA CCTATGACCTG-3'; Reverse, 5'-GCTTTTCACTATGTCG CTCAACTG-3'); GAPDH, (Forward, 5'-AGGTCTGGTGT GAACGGATTG-3'; Reverse, 5'-GGGGTGCTGTGATG-3').
GCAACA-3'); U6, (Forward, 5’-ACCCTGAGAAATACCCTCACAT-3'; Reverse, 5’-GACGACTGAGCCCTGATG-3').

3-(4, 5-Dimethyl-2-Thiazolyl)-2, 5-Diphenyl-2-H-Tetrazolium Bromide (MTT) Assay and Flow Cytometry Assay

Cell viability and apoptosis were evaluated by MTT assay and flow cytometry assay, respectively. For MTT assay, transfected A549 and H460 cells (5000 cells/well) were seeded on 96-well plates for 24 h, 48 h, 72 h and 96 h. Then, the cells were reacted with 10 μL MTT reagent (Beyotime, Shanghai, China) and kept for an additional 4 h. The OD value at 490 nm was measured by a spectrophotometer (Thermo Fisher Scientific, Waltham, MA, USA). For flow cytometry assay, transfected A549 and H460 cells were collected, stained using Annexin V-FITC/PI Apoptosis Detection Kit (Vazyme, Nanjing, China) and analyzed by BD FACS Canto II flow cytometry (BD Biosciences, Franklin Lakes, NJ, USA).

Western Blot Assay

Western blot assay was performed following the standard protocol. In brief, after total protein was isolated and quantified, the proteins were separated by sodium dodecyl sulfate-polyacrylamide gel (SDS-PAGE; Solarbio, Beijing, China) and then transferred onto polyvinylidene difluoride membranes (PVDF; Pall Corporation, New York, NYC, USA). Next, the membranes were blocked in skim milk for 2 h and then incubated with primary antibodies against ATG3 (ab108251; 1:2000; Abcam, Cambridge, MA, USA), LC3 II/LC3 I (ab128025; 1:200; Abcam), P62 (ab56416; 1:500; Abcam), B-cell lymphoma-2 (BCL-2; ab196495; 1:1000; Abcam), cleaved caspase-3 (ab49822; 1:500; Abcam), cleaved caspase-9 (ab2324; 1:2000; Abcam), BCL2-Associated X (Bax; ab182733; 1:2000; Abcam) or GAPDH (ab181602; 1:5000; Abcam) at 4°C overnight followed by incubation with HRP-conjugated secondary antibody (D110150; 1:5000; Sangon, Shanghai, China) for 2 h. The protein bands were analyzed using an enhanced chemiluminescence reagent (Beyotime).

Murine Xenograft Assay

Male nude mice of 5 weeks old were purchased from Vital River Laboratory Animal Technology (Beijing, China). Our animal experiment protocols were approved by the Ethics Committee of The First Affiliated Hospital of Zhengzhou University and performed according to the NIH guidelines for the care and use of laboratory animals (NIH Publication No. 85–23 Rev.1985). In brief, A549 and H460 cells stably transfected with sh-KCNQ1OT1 and sh-NC were subcutaneously injected in mice to establish xenograft mice model. Tumor volume was measured every 4 d from day 8 and calculated using the formula: (length×width²)/2. Tumor weight was measured after 28 d and tumors were harvested and preserved at −80°C.

Immunohistochemistry (IHC) Staining Assay

The tissue sections were deparaffinized, rehydrated using a graded ethanol series and heated in citrate buffer for antigen retrieval. Then, the sections were washed, blocked and incubated with normal goat serum. Then, the samples were incubated with a primary antibody anti-Ki67 (ab15580; 1:500; Abcam) at 4°C overnight and secondary antibody (ab205718; 1:5000; Abcam). The sections were stained
with diaminobenzidine (DAB) and then counterstained with hematoxylin, dehydrated and mounted. At last, the section was photographed using a digital microscope camera (Nikon, Tokyo, Japan).

Statistical Analysis
All the experiments were conducted at least in triplicate and data were presented as means ± standard deviation (SD). Statistical analysis was carried out using SPSS 13.0 software (SPSS, Chicago, IL, USA) and GraphPad Prism 7 (GraphPad Inc., San Diego, CA, USA). The correlation between miR-204-5p and KCNQ1OT1 or ATG3 was analyzed by Pearson’s correlation coefficient analysis. P value less than 0.05 (P<0.05) was considered as statistically significant.

Results
KCNQ1OT1 Depletion Induces Apoptosis and Suppresses Proliferation and Autophagy in NSCLC Cells
The functions of KCNQ1OT1 on NSCLC cell proliferation, apoptosis and autophagy were assessed by MTT assay, flow cytometry analysis and Western blot assay, respectively. As illustrated in Figure 1A and B, KCNQ1OT1 expression was extremely higher in NSCLC tumor tissues than that in the corresponding normal tissues. Likewise, KCNQ1OT1 expression was up-regulated in NSCLC cell lines (HCC827, H1299, A549, H460) compared with human bronchial epithelial cell BEAS-2B (Figure 1C). Furthermore,
loss-of-function experiments were employed by knocking down KCNQ1OT1 to explore the regulatory effects of KCNQ1OT1 on NSCLC cell progression. An obvious reduction of KCNQ1OT1 expression was noticed in A549 and H460 cells stably transfected with sh-KCNQ1OT1, indicating the transfection efficiency was relatively high (Figure 1D). Moreover, cell growth was inhibited apparently in NSCLC cells after KCNQ1OT1 silencing (Figure 1E and F). On the contrary, the cell apoptosis rate was enhanced in the sh-KCNQ1OT1 transfected group compared with sh-NC group (Figure 1G). Hence, the expression of apoptosis-related proteins was measured. We found that Bax, cleaved caspase-3 and cleaved caspase-9 were dramatically elevated whereas anti-apoptosis protein BCL-2 was decreased in both A549 and H460 cells stably transfected with sh-KCNQ1OT1 (Figure 1H and I). We also analyzed the expression of autophagy markers LC3 and P62 and observed that deficiency of KCNQ1OT1 repressed LC3II/LC3I expression and boosted P62 expression (Figure 1J and K). Collectively, KCNQ1OT1 knockdown induced apoptosis and suppressed proliferation and autophagy in NSCLC cells.

KCNQ1OT1 is a Sponge of miR-204-5p
Growing evidence has validated that IncRNA KCNQ1OT1 exerts its function by sponging the target miRNA. As searched by the online prediction tool StarBase v2.0, miR-204-5p includes the binding sites of KCNQ1OT1 (Figure 2A). To confirm the prediction, wild type (WT-KCNQ1OT1) and mutant type (MUT-KCNQ1OT1) vectors were constructed and co-transfected into A549 and H460 cells with miR-204-5p or miR-NC to establish dual-luciferase reporter system. Luciferase activity was reduced evidently in NSCLC cells co-transfected with WT-KCNQ1OT1 and miR-204-5p compared to WT-KCNQ1OT1 and miR-NC co-transfected cells, while luciferase activity in MUT-KCNQ1OT1 transfection group remained unchanged (Figure 2B and C). Additionally, the RIP assay indicated that the enrichment of miR-204-5p in the Anti-Ago2 RIP group was elevated in NSCLC cells transfected with KCNQ1OT1 or pcDNA (Figure 2D-F). The expression of miR-204-5p in NSCLC tumor tissues and normal tissues was also measured. miR-204-5p expression was significantly lower in NSCLC tissues compared to normal tissues (Figure 2G). The expression of miR-204-5p in NSCLC cell lines (HCC827, H1299, A549, H460) and human bronchial epithelial cell BEAS-2B was also measured (Figure 2H). The correlation between expression of KCNQ1OT1 and miR-204-5p was analyzed, and a significant negative correlation was found (r = -0.7785, P < 0.0001). *P < 0.05, ***P < 0.001.

Figure 2. KCNQ1OT1 directly interacted with miR-204-5p. (A) The putative binding sites between KCNQ1OT1 and miR-204-5p. (B, C) Luciferase activity of A549 (B) and H460 cells (C) co-transfected with WT-KCNQ1OT1 or MUT-KCNQ1OT1 and miR-204-5p or miR-NC. (D) The enrichment of miR-204-5p in Anti-Ago2 immunoprecipitation complex in A549 and H460 cells transfected with KCNQ1OT1 or pcDNA. (E, F) The expression of miR-204-5p in A549 (E) and H460 cells (F) transfected with KCNQ1OT1, sh-KCNQ1OT1, pcDNA or sh-NC. (G, H) The expression of miR-204-5p in NSCLC tumor tissues and normal tissues. (I) The expression of miR-204-5p in NSCLC cell lines (HCC827, H1299, A549, H460) and human bronchial epithelial cell BEAS-2B. (J) The correlation between expression of KCNQ1OT1 and miR-204-5p (r = -0.7785, P < 0.0001). *P < 0.05, ***P < 0.001.
with KCNQ1OT1 (Figure 2D). More importantly, overexpression of KCNQ1OT1 repressed miR-204-5p expression whereas depletion of KCNQ1OT1 facilitated miR-204-5p expression (Figure 2E and F). Subsequently, we discovered that the expression of miR-204-5p was down-regulated in NSCLC tumor tissues and cell lines compared with normal tissues (Figure 2G and H) and cells (Figure 2I). Pearson’s correlation coefficient analysis exhibited that KCNQ1OT1 was negatively correlated with miR-204-5p (r=−0.7785, P<0.0001) in NSCLC tissues (Figure 2J). These findings demonstrated that KCNQ1OT1 acted as a sponge of miR-204-5p.

**KCNQ1OT1 Regulates Proliferation, Apoptosis and Autophagy by Binding to miR-204-5p in NSCLC Cells**

To explore whether KCNQ1OT1 could regulate NSCLC progression by binding to miR-204-5p, A549 and H460 cells were transfected with sh-KCNQ1OT1+anti-miR-204-5p, sh-KCNQ1OT1+anti-miR-NC, sh-KCNQ1OT1 or sh-NC. As exhibited in Figure 3A, all the vectors were transfected into A549 and H460 cells successfully with high transfection efficiency. MTT results revealed that miR-204-5p inhibitor could abrogate KCNQ1OT1 silencing induced inhibition on cell proliferation in NSCLC (Figure 3B and C). Conversely, the KCNQ1OT1 knockdown promoted the apoptosis of A549 and H460 cells and miR-204-5p inhibitor rescued the effect (Figure 3D). Consistently, KCNQ1OT1 knockdown enhanced the expression of apoptosis-related protein Bax, cleaved caspase-3 and cleaved caspase-9, and reduced the expression of anti-apoptosis protein BCL-2. However, the miR-204-5p inhibitor reversed the trends (Figure 3E and F). Furthermore, the level of LC3II/LC3I was decreased whereas P62 was increased after KCNQ1OT1 silencing; however, the miR-204-5p inhibitor transfection group overturned the effects (Figure 3G and H). All the data implicated that KCNQ1OT1 regulated
proliferation, apoptosis and autophagy by interacting with miR-204-5p in NSCLC cells.

ATG3 is a Target of miR-204-5p

Based on bioinformatics analysis using StarBase v2.0, miR-204-5p comprised the binding sites of 3’UTR ATG3 (Figure 4A). Dual-luciferase reporter assay exhibited that luciferase activity was relatively lower in NSCLC cells co-transfected with ATG3 3’UTR-WT and miR-204-5p or miR-NC than ATG3 3’UTR-WT or ATG3 3’UTR-MUT and miR-204-5p or miR-NC (D, E). Protein expression of ATG3 in A549 (D) and H460 cells (E) transfected with miR-204-5p, anti-miR-204-5p, anti-miR-NC or miR-NC. (F, G) The expression of ATG3 in NSCLC tumor tissues and normal tissues. (H) The correlation between ATG3 and miR-204-5p (r=-0.6014, P<0.0001). (I, J) The expression of ATG3 mRNA (I) and protein (J) in NSCLC cell lines (HCC827, H1299, A549, H460) and human bronchial epithelial cells BEAS-2B. *P<0.05, ***P<0.001.

ATG3 Overexpression Reverses miR-204-5p Mediated Regulatory Effects on Proliferation, Apoptosis and Autophagy in NSCLC Cells

Following confirmation that ATG3 is a target of miR-204-5p, A549 and H460 cells were transfected with miR-204-5p+ATG3, miR-204-5p+pcDNA, miR-204-5p or miR-NC to illuminate the effects of miR-204-5p/ATG3 axis on NSCLC cell development. As presented in Figure 5A, the expression of ATG3 protein was raised in NSCLC cells transfected with ATG3 compared with the pcDNA group. As expected, ATG3 expression was up-regulated in NSCLC tumor tissues compared with normal tissues (Figure 4F and G). Then, we found ATG3 expression was negatively correlated with miR-204-5p expression in NSCLC tissues, as illustrated by Person’s correlation coefficient analysis (r=-0.6014, P<0.0001) (Figure 4H). Similarly, the mRNA and protein levels of ATG3 were considerably higher in NSCLC cell lines (HCC827, H1299, A549, H460) than those in BEAS-2B cells (Figure 4I and J). Altogether, ATG3 was a target of miR-204-5p.
repressed by the overexpression of ATG3. However, the anti-apoptosis protein BCL-2 expression showed the opposite results (Figure 5E and F). In addition, the ratio of LC3II/LC3I was reduced while P62 protein expression was increased by miR-204-5p; however, the effects were reversed by ATG3 (Figure 5G and H). The results clarified that miR-204-5p could regulate NSCLC cell proliferation, apoptosis and autophagy through ATG3.

Silencing of KCNQ1OT1 Inhibits Tumor Growth in vivo

Subsequently, xenograft model was established by subcutaneously injecting sh-KCNQ1OT1 and sh-NC stably transfected A549 and H460 cells into the nude mice. We found that tumor growth was significantly repressed in the xenograft model stably transfected with sh-KCNQ1OT1 compared with sh-NC group (Figure 6A and B). Similarly, tumor weight was lower in sh-KCNQ1OT1 transfected mice than sh-NC group (Figure 6C and D). Besides, the expression of KCNQ1OT1 and ATG3 was down-regulated whereas miR-204-5p was up-regulated in the tissue samples collected from sh-KCNQ1OT1 transfected group (Figure 6E and F). More importantly, the levels of ATG3, LC3II/LC3I, BCL-2 were suppressed whereas P62, Bax, cleaved caspase-3, cleaved caspase-9 were promoted in sh-KCNQ1OT1 group (Figure 6G). IHC staining assay indicated that KCNQ1OT1 knockdown led to a significant decrease in the percentage of ki67-positive cells compared to sh-NC group (Figure 6H). Taken together, KCNQ1OT1 silencing suppressed tumor growth in vivo by accelerating apoptosis and suppressing autophagy in NSCLC.

Discussion

LncRNAs have been demonstrated to be associated with the progression of diverse human cancers, including NSCLC. In this study, we aimed to explore the function of lncRNA...
Previous studies have identified that lncRNA KCNQ1OT1 is an essential prognosis biomarker in a variety of diseases, including diabetic retinopathy, osteolysis and breast cancer, while the function and the molecular mechanism of KCNQ1OT1 in NSCLC progression were not fully validated. KCNQ1OT1 was up-regulated in breast cancer and overexpression of KCNQ1OT1 accelerated cell growth in vitro and repressed tumor growth in vivo by enhancing CCNE2 via sponging miR-145. Upregulation of KCNQ1OT1 stimulated NSCLC cell progression by inhibiting miRNA-27b-3p and boosting HSP90AA1 expression. Additionally, KCNQ1OT1 promoted cell development as well as cisplatin resistance against tongue cancer by targeting miR-211-5p to alter Ezrin/Fak/Src signaling pathway. Consistently, KCNQ1OT1 enhanced oxaliplatin resistance by modulating the miR-34a/ATG4B axis in colon cancer.

MiR-204-5p was identified to be a target of KCNQ1OT1 in this study. Interestingly, miR-204-5p was found to be an autophagy-associated gene in several tumor types, such as rhabdomyosarcoma, endometrial and colorectal cancer. In addition, Luan et al reported that miR-204-5p improved cell sensitivity to chemotherapy and inhibited melanoma growth by targeting MMP9 and B-cell lymphoma-2. Similarly, miR-204-5p enhanced chemotherapeutic sensitivity and repressed invasion of colorectal cancer cells by interacting with RAB22A. Moreover, miR-204-5p was clarified...
to weaken cell proliferation and induce cell apoptosis in papillary thyroid carcinoma as well as expedite apoptosis and repress cell metastasis in osteosarcoma by targeting IGFBP5 and EBF2, respectively.\textsuperscript{38,39} Therefore, we speculated that miR-204-5p functioned as a tumor suppressor to suppress proliferation, migration, invasion and autophagy as well as enhance apoptosis of NSCLC cells.

Wang et al declared that miR-16 could target the 3’ UTR of ATG to hamper TGF-β1-induced epithelial-to-mesenchymal transition (EMT) via the activation of autophagy in NSCLC.\textsuperscript{24} Hua et al reported that miR-1/ATG3 participated in the regulation of chemoresistance in NSCLC.\textsuperscript{25} Thus, we speculated that KCNQ1OT1 modulated proliferation, apoptosis and autophagy of NSCLC cells via modulating miR-204-5p/ATG3 axis. Initially, we noticed that the expression of KCNQ1OT1 and ATG3 was up-regulated whereas miR-204-5p was down-regulated in NSCLC tumors and cells compared with the corresponding normal tissues and cells. As expected, KCNQ1OT1 knockdown expedited apoptosis and repressed proliferation and autophagy of NSCLC cells in vitro and in vivo. However, the miR-204-5p inhibitor reversed the effects. The rescue experiments also displayed that ATG3 elevation abolished miR-204-5p mediated regulatory effects on cell proliferation, apoptosis and autophagy in NSCLC.

In conclusion, we clarified that KCNQ1OT1 contributes to cell proliferation and autophagy and suppresses cell apoptosis by altering the miR-204-5p/ATG3 axis in NSCLC. Our study represented potential biomarkers for targeted therapy of NSCLC.
