Dear editor

I have read the study of Mirmosayyeb et al entitled “Comparison of Psychological Difficulties in Patients with Migraine and Epilepsy Using PARADISE-24 Questionnaire” with great interest. In this paper, the authors reported their study on comparing psychological difficulties in patients with migraine and those with epilepsy by using the PARADISE-24 questionnaire.¹

This research is very useful in the assessment of psychological difficulties in patients with migraine and epilepsy. I found a few things that need to be written by the author. Firstly, the authors mention that they used the Independent sample *t*-test and Fisher exact test were used for comparison between quantitative and qualitative variables. However, no results were found from the test. If indeed the test has been carried out, it is necessary to be included in the results section. Comparison with the test will be better than just using the mean $\pm$ SD comparison.

In selecting the number of respondents, the authors revealed that the data were gathered from 240 migraineurs and 210 patients with epilepsy. This difference in the number of respondents will certainly lead to gaps in the results of the study. Authors need to explain what is the impact of the different numbers of respondents in each group.

The authors chose migraine and epilepsy as variables to compare. In a previous study in the development of the PARADISE-24 Questionnaire, Cieza et al tested several variables including dementia, stroke, multiple sclerosis (MS), epilepsy, migraine, Parkinson's Disease (PD), depression, schizophrenia or substance dependency.² The authors need to explain in more detail about the selection of these two variables and need to consider several other variables to be used in the study to be compared.

Disclosure

The authors report no conflicts of interest in this communication.

Publish your work in this journal

The Journal of Multidisciplinary Healthcare is an international, peer-reviewed open-access journal that aims to represent and publish research in healthcare areas delivered by practitioners of different disciplines. This includes studies and reviews conducted by multidisciplinary teams as well as research which evaluates the results or conduct of such teams or healthcare processes in general. The journal

covers a very wide range of areas and welcomes submissions from practitioners at all levels, from all over the world. The manuscript management system is completely online and includes a very quick and fair peer-review system. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.
