Background: How to cope with the rapid growth of LTC (long-term care) needs for the old people without activities of daily living (ADL), which is also a serious hazard caused by public health emergencies such as COVID-2019 and SARS (2003), has become an urgent task in China, Germany, Japan, and other aging countries. As a response, the LTCI (long-term care insurance) system has been executed among European countries and piloted in 15 cities of China in 2016. Subsequently, the influence and dilemma of LTCI system have become a hot academic topic in the past 20 years.

Methods: The review was carried out to reveal the effects of the LTCI system on different economic entities by reviewing relevant literature published from January 2008 to September 2019. The quality of 25 quantitative and 24 qualitative articles was evaluated using the JBI and CASP critical evaluation checklist, respectively.

Results: The review systematically examines the effects of the LTCI system on different microeconomic entities such as caretakers or their families and macroeconomic entities such as government spending. The results show that the LTCI system has a great impact on social welfare. For example, LTCI has a positive effect on the health and life quality of the disabled elderly. However, the role of LTCI in alleviating the financial burden on families with the disabled elderly may be limited.

Conclusion: Implementation of LTCI system not only in reducing the physical and mental health problems of health care recipients and providers, and the economic burden of their families, but also promote the development of health care service industry and further improvement of the health care system. However, the dilemma and sustainable development of the LTCI system is the government needs to focus on in the future due to the sustainability of its funding sources.

Keywords: aging society, LTC, long-term care, LTCI, long-term care insurance, fund-raising, effectiveness, dilemma

Introduction
The aging of the global population has created an enormous demand for LTC (Long-Term Care) for the old people without activities of daily living (ADL) and with a heavy financial burden on their family.1 The European and American countries, such as the Netherlands in the 1960s and the United States in the 1970s, have introduced LTCI (Long-Term Care Insurance), but it exists only as a kind of insurance under the Health insurance. In 1995, Germany took the lead in setting up LTCI (Long-Term Care Insurance) system, which became the sixth
largest independent insurance system after health insurance, unemployment insurance and other insurance systems. To a large extent, it meets the needs of LTC services for the elderly and alleviates the poverty of the elderly caused by personal payment.\footnote{LTCI system, including public LTCI (government-mandated) and private LTCI (individual voluntary), refers to an institutional arrangement to share the nursing expenses incurred by people who cannot take care of themselves due to chronic diseases or physical and psychological disability (WHO).\textsuperscript{3} The European and American countries have their characteristics in the specific implementation policies of the LTCI system, such as fundraising. For example, Germany was the first country to implement the LTCI system in the form of social legislation. In 1995, the LTCI law came into effect and became the fifth pillar insurance, along with endowment insurance, medical insurance, accident insurance, and unemployment insurance. German LTCI system emphasizes two essential principles, namely, “Home care priority” and “Prevention and rehabilitation priority.” All medical insurance policyholders must attend the LTCI, regardless of gender or age as long as an adult. LTCI system in Germany emphasizes the “peer-to-peer” rights and obligations (Beneficiaries must pay certain fees in advance).\textsuperscript{3,5} Another type of LTCI system is the full coverage model of LTCI benefits in the Nordic. In addition, Japan, the East Asian countries' neighbors of China, have implemented LTCI system since 2000. All the applicants can decide the care level in the amount available and the care beyond a fixed amount must be undertaken privately. All of them are all facing sustainable development problems because of the lack of funds.

In China, private LTCI is still in its infancy, while public LTCI is partly funded by medical insurance, and together with general SOSS (Social Old-age Service Security), such as endowment insurance, forms part of the provision of health services for the elderly. It is different between LTCI and SOSS. First, SOSS mainly provides daily life for the elderly, while LTCI not only includes life help but also includes health care and psychological comfort. Second, SOSS is funded by public finance grants, welfare lotteries, and individual contributions. LTCI (public LTCI in China mainly) was made up of part of medical insurance, which paid by employers, employees, and the government financial burden. Third, SOSS mainly provides free or low-fee services for the “Three no” (no work, no income, no provider) elderly, and disabled or semi-disabled elderly, while LTCI offers different services for the corresponding time according to the disability level identified when the elderly apply for services.

The rapid aging of the population has emphasized the emergency of health care for the old people in China. The elderly without activities of daily living (ADL) caused by chronic diseases, environmental pollution, or accidental injuries is increasing, and the prevalence rate of chronic diseases in the elderly is as high as 54%.\textsuperscript{6–10} Although the LTC services demand for the elderly was snowballing, the provision of LTC services such as fundraising far from keeping up with its demand. As a countermeasure, the public LTCI system was piloted in 15 cities since 2016, including Qingdao of Shandong province, Chengdu of Sichuan province, and Chongqing, which had a profound impact on the people and economies of the pilot areas (as shown in Table 1). The implementation of LTCI system in China has produced certain economic and social impacts, but due to its short implementation time, the policy effect is not significant enough, and relevant academic research is not in-depth enough, so there is still a lot of research space in both quantitative and qualitative research.

The implementation of LTCI system in China has produced specific economic and social impacts, but due to its short implementation time, the policy effect is not significant enough, and relevant academic research is not in-depth enough. In view of the high rate of disability and deaths among the elderly of SARS (2003) and COVID-2019, it is imperative to deepen the LTCI system in the “post-COVID-2019 era” in order to mitigate the negative impact of COVID-2019 and similar public health emergencies that may occur again in the future. The purpose of this paper is twofold: a) Systematically sorted the existing related literature at China and abroad, aimed at the impact of LTCI system on the microscopic economic entities such as nursing care recipients and the family, as well as to the macroeconomic entities such as national economy, social welfare, etc. And then try to find out the LTCI system development, continue to deepen the research direction and space, and put forward further research prospects. b) Learn from the experiences of the LTCI system in other countries and further promote the in-depth reform of the LTCI system in China by comparing the social welfare impact of the LTCI system in China with other countries.

\section*{Materials and Methods}
The review was implemented to reveal the effects of the LTCI system on different economic entities by reviewing
relevant literature published from January 2008 to September 2019.

Design
This review methodology followed the checklist presented by PRISMA (the Project for Systematic Review and Meta-Analysis Preferred Reporting), which is useful for critical appraisal of published systematic reviews, although it is not a quality assessment tool to measure the quality of a systematic review. Meanwhile, this review used JBI Critical Appraisal Checklist to evaluate the quality of the quantitative research, and the Critical Appraisal Skills Programme (CASP) to assess the quality of the qualitative research.

Search Process and Inclusion Criteria
The following primary databases were taken into account: Web of Science (WOS), PubMed, Medline, CNKI (China), and WanFangData (China) with time filter January 2008 to September 2019. The following mixtures of nouns were practiced under the word “and/or” to top limit the range and type of material searched: “LTCI” OR “Long-Term Care Insurance” and “economic” AND “effect”. The review is included in the study published before September 2019 when our review begins writing, and not included the conference summary or editorials. Finally, 49 articles were retained for the review.

Data Extraction Process
Our review methodology followed the checklist presented by PRISMA (the Project for Systematic Review and Meta-Analysis Preferred Reporting), which was published in 2009 and consists of a checklist and a flow diagram.11 Three reviewers appraised the studies for inclusion. The material extracted from the included publication included the study purpose, analysis tools, outcome measurements, and time frames. The data extraction process is made in Figure 1.

Quality Appraisal
The JBI Critical Appraisal Checklist was used to evaluate the quality of the 25 quantitative articles, and The Critical Appraisal Skills Programme (CASP) was used to assess the value of the 24 qualitative articles.

Firstly, we assessed the quality of each article based on the JBI Critical Appraisal Checklist. As designed for use in systematic reviews, JBI (Joanna Briggs Institute)
Critical Appraisal Tools have been developed by the JBI Scientific Committee following extensive peer review. All features of the study that meet the following eight criteria are included in the final summary: (1) distinct purpose; (2) complete information of sample variable; (3) data foundation; (4) the effective of data sorting; (5) thought of ethical rules; (6) suggestions; (7) effective results; and (8) application of an appropriate quantitative methodology and clearly stated findings. The methodological quality was appraised by the yes/no questions listed in the JBI Critical Appraisal Checklist. Averagely, each article concerning analytics scored 7.5 out of 8. Out of 25 articles, seven articles did not detail the data source. Secondly, the CASP (Critical Appraisal Skills Programme) checklist was used to assess the quality of the 24 qualitative articles. Critical Appraisal Skills Programme (CASP) was developed in 1993 and helped develop an evidence-based approach to health and social care. Five questions (out of 10) in the checklist were not appropriate to the qualitative articles. So, we assessed the articles on a 5-point scale. Articles included in our review displayed high methodological quality as 18 articles (out of 24) scored 5. We adopted the three-step processing method proposed by Levy et al to summarize the knowledge system. First, during the review process, we extract the information we need by identifying the title, defining the problem, and listing the more critical findings. We then compared each article with articles related to similar issues to ensure that no irrelevant

Figure 1 Data extraction process (PRISMA).
information was considered. The final relevant information was aggregated and stored in Excel. The final classification provides abstracts, conclusions, and possible reviewer comments for different articles.

Results
A Brief Review of Relevant Literature
The review includes 49 articles, of which 25 are quantitative articles, and 24 are qualitative articles. Our results showed that qualitative or quantitative analysis accounted for roughly half of all the literature, but qualitative research accounted for 72% of the literature in Chinese, while quantitative research accounted for 80.7% of the literature in English. Besides, more and more articles have been published on the influence of LTCI system, especially in the last 2 years (2018 and 2019) accounted for more than 50% of all relevant papers published in this decade. Furthermore, the classification of articles published focused on the influence and dilemma of LTCI system in different countries is presented in Figure 2.

As can be seen from Figure 2, of all 49 articles, the most studied countries are China, Japan, Germany, the United States, and South Korea. There was some literature on the study of Nordic welfare states such as Denmark and Sweden, but the number is not large. In addition, few studies on the LTCI system in developing countries except China. For example, a well-known scholar named Lloyd-sherlock has published several articles focused on Argentina and studies the availability of LTC infrastructure and formal services for the old people.15,16

Micro Perspective: Effects of LTCI on Caretakers and Their Families
As shown in Table 2, from the point of view of the microscopic subject, the influence of LTCI (Long-Term Care Insurance) was mainly reflected in the effects on the health and quality of life of the caretakers, the financial burden on the caretakers and their families, and the choice of different types of care, etc.

Effects of LTCI on the Health and Quality of Life of the Caretakers
The effects on the health of the disabled elderly are the primary objective of LTCI implementation. Choi and Joung used Cox proportional risk regression model to prove that LTCI services can help reduce health expenditure and protect the health of the elderly aged 65 and above.17 Lee et al compared the changes in cognitive function, behavioral symptoms, and physical function of Korean LTCI care and individual care in 1 year and found that the elderly experienced less cognitive decline and decreased disability progression in LTCI care.18 Milte et al found a strong association between processes of care delivery and quality of life of care recipients.19 All the theoretical research is becoming more and more in-depth, which were conducted from the perspectives of

Effects of LTCI on the Financial Burden on the
Caregivers and Their Families
Most studies have confirmed that LTCI can help reduce the
financial burden on families with the disabled elderly. Sugiyama et al believed that Japan’s public compulsory
LTCI system alleviated the nursing burden of home care-
givers for the elderly. \(^2^0\) Iwamoto and Saito found that
LTCI (Long-Term Care Insurance) helps Japanese families
to reduce the welfare losses associated with disabled
family members. \(^2^1\) Other Japanese scholars Tamiya have
different views, and he thinks the LTCI was challenged by
the dissatisfaction of necessary support for the family
caregivers and the sustainability of the system. \(^2^2\) Chinese
scholar Chen et al believed that LTCI could effectively
reduce the cost of old-age care and the double burden of
family economic life because of the shrinking family size,
the soaring number of empty-nest families, and the rising
nursing costs in China. \(^2^3\) Other researchers have taken this
step further by dividing dysfunctional elderly families into
high-income and low-income families, for example, Kim
and Lim found that in South Korea, government nursing
subsidy can lead to an increase in the use of formal long-
term care but has a limited impact on people with better
income status. \(^2^4\)

Effects of LTCI on Nursing Workforce Providers
LTCI’s impact on the labor market is not well studied,
but it is a meaningful topic that deserves further study.
Geyer and Korhage proposed that home care is gener-
ally considered as a cost-saving alternative to formal
home care and fixed care, but the opportunity cost
cased by the reduced supply of caregivers was often
overlooked. Many informal caregivers are of working
age and face the dual burden of providing care and work. \(^2^5\) Sakka found that the reduction of the burden of
care for dementia patients and the reduction of beha-
Vioral and psychological symptoms of dementia are of
great significance to the reduction of family–work con-
flict and the maintenance of work–life balance for
employed family caregivers. \(^2^6\) Umegaki et al conducted
a survey and found that a total of 68.8% of nursing staff
said that the introduction of LTCI service reduced the
nursing burden, and 86.8% of nursing staff were satis-
\(\text{fied with LTCI nursing service.} \(^2^7\) These only studies
have analyzed the dilemma between going to work and
taking care of the disabled elderly facing family mem-
bers through micro survey research.

Effects of LTCI on the Choice of Different Types of Care
The choice of different types of care is related not only to
the wishes of the disabled elderly themselves but also to
the wishes of their family members. Schmitz et al used
data from the German socio-economic group and found
that informal nursing had a considerable negative short-
term impact on the mental health of female caregivers,
which gradually disappeared over time. After 5 years of
care, the effect was still negative, but small and insigni-
\(\text{ficant, with virtually zero short - and medium-term effects}
\text{on health.} \(^2^8\) Gao proposed that parents’ long-term care
experience would, in turn, influence their children’s will-
ing to long-term care. \(^2^9\) Cao et al found that parents’
use of nursing homes reduced people’s expectation of
informal care for their children, and parents or in-laws’
use of nursing homes increased the probability of LTCI
purchase by 0.8 percentage points. \(^3^0\) Tsai, another scholar,
proposed that with the increase of retirement income,
higher social security benefits would encourage those
who would not otherwise use any home care to use formal
home care, and the elderly would be encouraged to use
these two types of home care services. Future needs will
increasingly include high-demand care for people with
cognitive and physical disabilities. \(^3^1\) Lehnert et al pro-
posed that more than half of the respondents preferred
home (community) care. \(^3^2\) To sum up, both the disabled
elderly and their family members’ choices are related to
economic income, social insurance, and other factors.

Macro Perspective: Effects of LTCI on National Economic Welfare (Medical
Expenses, Nursing Industry, Finance, etc.)
LTCI system shows the specific influence on the whole
social welfare in release effective demand for Long-term
care, promote the public health service system to further
development, establish the LTCI (Long-Term Care
Insurance) system, improving the efficiency of the Long-
term care service, etc.

Some scholars believe that LTCI helps release the
effective demand for long-term care. For example, Yang
thinks that the implementation of the LTCI system in
Shandong province not only meets the medical care
needs of the disabled elderly but also solves the problem
of excessive medical treatment in the previous
hospitalization, and achieves the effect of purchasing higher medical care services at a lower cost.33 Jiang argued that LTCI promotes the release of long-term care effective demand and utilization, promote the sustainable development of the medical service system.34

Others have discussed the impact of LTCI on government health spending and the burden on government budgets. For example, Lee argued that LTCI system has a positive impact on Japan’s economy and society, mainly embodied in reducing the burden of the medical expenses of long-term care family and government, ease the phenomenon of long-term care services in short supply and improve the employment level of the Japanese society.35 It is identical to the views of Hao, who argue that Germany’s LTCI system has achieved significant social reform achievements, reduce the state and the individual family’s heavy financial burden on the long-term care spending.36 Li summarized that the LTCI system in Nantong alleviates the economic burden of disabled personnel and promotes the coordinated development of the care system in urban and rural areas.37 Yu used a long synthetic control method to explore nursing risks influence on medical expenses and found that LTCI can effectively adjust the allocation and utilization of medical resources and fundamentally improve the overall social welfare.38 Geyer and Korfhage used the Labor supply structure model to quantify the indirect financial effects of informal care and showed that increasing formal care subsidies through LTCI had a considerable positive impact on the government budget.39

In addition to the above, other studies have focused on the impact of LTCI on the health care service industry in various regions. Shao found that LTCI of Qingdao is not only solved the problem of long-term care for the disabled elderly but also mobilized the rational allocation of medical resources and the full use of nursing insurance funds, which promoted the development of the elderly care industry and the nursing service industry.40 Shen et al established a systematic GMM model based on relevant data in China statistical yearbook and operation analysis report of national medical and maternity insurance from 2010 to 2017 and found that LTCI can significantly improve the operation efficiency of basic medical insurance for urban workers.41 Chen and Zhao proposed that the LTCI system and regional economic development have mutual influence and restriction, which constitute a complex coupling interaction system.42

Development Dilemma of LTCI
Although the LTCI system has produced many positive social effects, the enormous financial expenditure behind it has also brought a substantial economic burden to governments. Its future development will also be restricted by many factors, which are shown in Table 3.

Table 3 shows many constraints to the development of the LTCI system. For example, the price rise will increase the cost of long-term care and may result in a shortage of funding for public LTCI.45 Geyer and Korfhage found that benefits in kind and benefits in cash have different effects on the labor market for long-term care services.25 Lin et al argued that public LTCI and private LTCI are complementary and alternative.36

Discussion
It is a global problem of how to solve the enormous demand and its massive economic burden of long-term care services for the disabled elderly caused by the aging population. LTCI system is in response to this problem. However, there are still many difficulties, although the LTCI system has been implemented in Europe, such as Germany for 25 years (1995–2020), and has a positive impact on alleviating the long-term care crisis of the aging population. The topic of LTCI has also become an international academic frontier and a hot topic. Therefore, it is necessary to carry out a systematic review of relevant research literature, which is of great significance not only for the further improvement of the LTCI system in European and American countries but also for the aging countries just beginning to implement LTCI system like China. Moreover, Challenges posed by COVID-2019 for subsequent LTC services. Incapacitated or semi-incapacitated elderly with weak immunity due to chronic diseases are its main victims. Meanwhile, in view of the precedent of a high proportion of incapacitated patients with SARS (2003) after treatment, how the average family pays the high cost of care poses a higher challenge to the deepening and improvement of the LTCI system under the pilot.

Some information had been revealed by a preliminary review of relevant literature. First, more and more articles have been published on the social welfare impact of the LTCI system over time, especially in the last 2 years (2018 and 2019) accounted for more than 50% of all relevant papers published in the decade. It verified that the research on the social welfare impact of the LTCI system had been paid more and more attention from the academic circle. Second, the most studied countries are China, Japan, and other countries with large population density and increasingly severe population aging, indicating that the task of long-term care for disabled elderly has been quite tricky, and has been highly valued by governments and academia. One thing to point out

is that some Chinese scholars studied the LTCI system of Japan and Germany, reflecting the commonality of social security concepts between China and Japan, Germany. Third, few studies on the LTCI system in developing countries except China. This may have to do with the fact that economic growth remains the primary goal in most developing countries, and less attention has been paid to the area of long-term care for the disabled elderly.

While the implementation of the LTCI system has a great impact on social welfare, it also faces a great dilemma to be solved.

Firstly, it is shown that LTCI has a positive effect on the health and life quality of the disabled elderly. However, the beneficiaries of the LTCI system should be further expanded, especially in China with nearly 300 million elderly people. For example, some pilot cities in China such as Chongqing should gradually relax the conditions for enjoying the long-term care insurance treatment, such as “long-term bed or after treatment of no less than 6 months after the assessment of disability level to meet the criteria for severe disability”, can be appropriately relaxed to moderate disability, and then gradually expand to the full coverage of severe, moderate and mild disability. Geographically, the successful pilot experience of the public LTCI system in 15 pilot cities should also be expanded to more cities as soon as possible.

Secondly, LTCI’s impact on the labor market is a meaningful topic that deserves further study. The dilemma between going to work and taking care of the disabled elderly facing family members due to the role of LTCI in alleviating the financial burden on families with the disabled elderly may be limited. It may also influence family choices about different forms of care. Therefore, the government has acted simultaneously in implementing the LTCI system from two aspects: improving the professional quality of nursing staff in long-term-care pension institutions, so as to reassure family members. At the same time, appropriately raise the current funding standard (eg, 150 yuan/person/year in Chongqing) and the payment standard of care (eg, 30–50 yuan/person/day in Chongqing).

Thirdly, from a macro point of view. LTCI system policy shows the specific influence on the whole social welfare in release effective demand for Long-term care, promote the public health service system to further development, establish the LTCI system, improving the efficiency of the Long-term care service, etc. However, its burden on government budget expenditure is also obvious. For example, Eggink et al found that the expected price increase in the future will lead to an annual increase of 3.5% in real future expenditure on long-term care in the Netherlands. Xu et al predicted the LTC costs for each disability state of the elderly during 2020–2050 in China. It is found that the future growth in LTC costs will be tremendous, and the role of LTCI will be even more evident, which is also a significant problem.
facing many countries around the world. Perhaps, it is a good idea that introducing social capital and strengthen the effective combination of private and public long-term care insurance to play an active role together.\textsuperscript{46,49,50}

Our systematic review shows that the research on the LTCI system has become an international frontier academic topic, and the research on the social welfare impact of LTCI has attracted more and more attention from scholars around the world, with more and more in-depth research contents. However, both the theoretical depth and the empirical method lag far behind the studies of scholars in Germany and other countries,\textsuperscript{2,51-53} which is also related to the late implementation of LTCI policy in China (since the pilot began in 2016), while that in Germany and other countries has been implemented for more than 20 years (since the 1990s). This provides a broad academic space for our future research. As we know, the formal implementation of pilot LTCI policies in 15 cities carried out from 2016 and reach its peak in 2018-2019 in China. Therefore, this systematic review led us to realize that, restricted by various factors such as Chinese traditional family concept,\textsuperscript{54} government responsibility boundary,\textsuperscript{55} and LTC needs assessment system,\textsuperscript{56,57} the LTCI system is a long-term process that needs to be improved continuously to truly meet the growing and changing long-term care needs,\textsuperscript{52} which is even more daunting in China having the largest elderly population in the world.

Due to the late start (2016), China’s LTCI system has some immature problems in the specific pilot process, such as fundraising or fund payment. Its impact on social welfare is too short to be obvious for the time being, and relevant studies in the academic circle are few and not in-depth enough. Therefore, this review does not make a more detailed comparison between the academic research results of China and other countries on this topic but combines them into a discussion. As China’s LTCI system has been in practice for a longer time, perhaps in 5 years or so, it would be a good choice to focus on the comparative analysis between China and other countries on the impact of long-term care insurance system on social welfare, which is also our future research focus.

Conclusions

Implementation of LTCI system not only in reducing the physical and mental health problems of health care recipients and providers, and the economic burden of their families, but also promote the development of health care service industry and further improvement of the medical and health care system. However, it cannot be ignored that there are two important questions facing the governments of all countries: a) How to deal with the huge financial expenditure behind public LTCI; and b) How to cooperate with other insurance such as endowment insurance to produce greater social welfare. Therefore, in the future studies, we should further deepen the research on the problems related to LTCI and clarify its influence mechanism, so as to find the right remedy for the disease and the solution to the problem.
