Dear editor

In Response to Oliveira et al:

While we agree that self-reflection is vitally important in applying feedback, our workshop focused on the ability to appropriately receive feedback in the moment (or in “real-time”). The skills taught in the live session were geared toward this clinical environment—when feedback provided may be brief and less formal than standard feedback sessions.

We would disagree regarding the requirement of measuring self-reflection in our study. Even if we accept the premise that self-reflection is necessary, it is certainly not sufficient for processing and applying feedback. Oliveira et al echo work by Stone et al¹ suggesting that an OSTE may be sensitive to changes in skills that are easy to incorporate immediately into practice while other areas may require practice and reflection. It may well be that once skills from our session are practiced and reflected upon, performance would indeed increase further. We do agree that it would be intriguing to build on this work by measuring the longitudinal impact of our workshop at the conclusion of clinical rotations.

A larger study that incorporates a self-reflection exercise and its ability to augment behavior change would be laudable. However, objectively adjudicating the quality of reflection in a rubric-like format, such as the OSTE rubric devised for this study, and validated by others,^{2,3} would be difficult. Measuring behavior change would also have been a welcome outcome of this study, though it would have been challenging to parse out whether the behavior change was from our workshop alone or from the additional unique experiences of each student during their clinical years. Rather, our workshop was designed to present a skillset for receiving feedback that our students would be able to refer to and practice throughout their clinical training and beyond.

We would also disagree with the notion that this approach is only applicable to undergraduate medical students. In fact, the ability to receive feedback inspired the content of a popular book entitled *Thanks for the Feedback*,⁴ in which two Harvard Law School professors describe the many situations in which we are presented with and respond to feedback in our lives. As the spirit of lifelong learning looms large in medicine, where we strive to always do better by our patients, we would argue that the ability to receive feedback applies to trainees and experienced practicing physicians alike.

Publish your work in this journal

Advances in Medical Education and Practice is an international, peer-reviewed, open access journal that aims to present and publish research on Medical Education covering medical, dental, nursing and allied health care professional education. The journal covers undergraduate education, postgraduate training and continuing medical education

including emerging trends and innovative models linking education, research, and health care services. The manuscript management system is completely online and includes a very quick and fair peer-review system. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.
