Introduction: It becomes a challenge for a teacher to find a student-friendly approach to teach too many students in a class. The teaching methods used during medical education have a significant impact on learning among medical students. A practical and informative teaching technique is considered an essential component of that education. The present study aimed to determine the best interactive teaching method based on Indian medical undergraduates' perceptions.

Materials and Methods: The current investigation was a cross-sectional descriptive study that included 100 undergraduate medical students. A structured sample class on a specified topic was conducted using Microsoft PowerPoint (PPT) and a "chalk and talk" (CNT) method. Students' opinions of the class were assessed via a Likert scale questionnaire in which, for each of the two methods, the students were asked to rank twelve comments on a four-point scale: strongly agree, agree, disagree, or strongly disagree. Descriptive statistics were calculated to evaluate the distributions of their responses. The z test for two proportions was used to test a significant difference in respondents' proportions towards various perceptions regarding the two teaching methods under study. The data were analyzed using SPSS software version 22.

Results: Students understood the lesson content better when the teacher used the CNT approach ($p < 0.005$). The CNT method was also associated with better interaction than the PPT technique ($p = 0.03$) and facilitated better student concentration and retention of the class content ($p = 0.03$). The students reported that there was less eye contact associated with the PPT technique (61%) but found the content thus delivered fascinating (78%), informative (91%), and organized (85%) as compared to the CNT approach.

Conclusion: The traditional CNT approach is an effective classroom teaching method. The current study highlights student preferences for a combined teaching method that includes CNT and PPT.

Keywords: classroom technique, medical education, student perspective, interactive teaching

Introduction

In recent decades classroom teaching methods have changed from the traditional CNT approach to the modern Microsoft PowerPoint (PPT) technique. Notably, however, which of the two is the best method can only be determined based on a better understanding of the lecture content by students.

In India, the National Medical Commission (NMC) comes into force, replacing the Medical Council of India (MCI) on 25.9.2020 with gazetted notification dated

24.9.2020. One of its objectives is to improve access to quality and affordable medical education to nearly 1,18,316 medical graduates and 30,000 postgraduates yearly from 554 medical colleges across the country.¹ Teaching such a vast number of students in different medical colleges are a difficult task for the teacher.

The educational environment perceived by students' influences satisfaction with their learning process and academic accomplishment.² The classroom setting has significantly impacted the student's behavior, academic progress, and a sense of well-being.³⁻⁵

The lecture delivery is a dynamic procedure where both the teacher and student have to work reciprocally to make this process pleasant and more remarkable for understanding.⁶

In the existing system of teaching-learning method, some students find it challenging to opine about the teaching way of a teacher, whether his technique was straightforward one or merely, the approach was excellent.⁷

During classroom tuition, the visual and auditory senses are used to absorb information. The assistance of visual aids is beneficial.⁸ The use of transparencies and an overhead projector was historically a commonly utilized⁷ and well known⁹ means of classroom teaching. Chalkboards are one of the most common¹⁰ methods of the lecture delivery process.

Microsoft PowerPoint software developed by Robert Gaskins and Dennis Austin was released in 1987 and was purchased by Microsoft Corporation in the same year. PowerPoint facilitates visual demonstrations for group presentations and widely used in the lecture presentation. It also has wide applications in educational and community organizations.¹¹ PPT helps the user to create a slide show of important information, charts, and images to display during a presentation with added features like subtitling on slides, slide transitions, background designs, animation, graphics, movie and sound clips, and Auto Content.^{11,12} PPT has recently become established as one of the most popular instructional aids,¹³⁻¹⁵ in conjunction with the computer becoming an unavoidable aid in modern-day classroom teaching. Nowadays, PPT has become the most common and straightforward method used by teachers to create classroom presentations,¹⁶ and millions of copies of the program are currently in circulation and used worldwide every day.¹⁷ Some surveys have been conducted to determine the usefulness of different teaching methods. The earlier CNT methods of lecturing were the methods most preferred by medical students in a study reported in 2007,¹⁸ though PPT is now standard.¹⁶

Because of the above differences in preferences, the present study aimed to assess students' perceptions by comparing the PPT method with the traditional CNT approach. The study also seeks to find the best-suited way of teaching-learning to the needs of the Indian medical students from their perspective.

Materials and Methods

The present study was a cross-sectional descriptive survey that included 100 undergraduate 4th-semester MBBS students of Assam Medical College and Hospital, Dibrugarh, Assam, India, from October 2020 to February 2021. The study participants were selected using a simple random sampling method. A semi-structured questionnaire was used to collect information about the students' likings and observations regarding the theory class's teaching-learning approach. A structured sample class on a predetermined lecture topic was delivered using PPT and CNT, and students' perceptions were ascertained via a Likert scale questionnaire. For each of the two methods, the students were asked to rank twelve comments on a four-point scale: strongly agree, agree, disagree, or strongly disagree. Each student was asked to mark their responses in two different questionnaires on the two different teaching methods (Table 1).

Table 1 Statements Regarding the Perception of the Two Teaching Methods

Question No.	Statements Regarding Perception
Q1	I understand the lecture better when the teacher uses this technique
Q2	I feel the student interaction is better with the teacher
Q3	Eye contact between teacher and student is less
Q4	The lecture advances the understanding
Q5	This technique helps me to concentrate and remember better
Q6	The quality and quantity of my lecture notes cannot be maintained
Q7	The delivery of the lecture is interesting
Q8	The content of the lecture informative
Q9	The lecture is audible
Q10	The lecture content was well organized
Q11	The teacher remains more professional
Q12	The teacher needs more preparation for the class

Thus, further analysis in the present study was done with a total of 200 questionnaires. The validity and reliability of the questionnaire were tested using appropriate methods. The questionnaire's reliability in assessing the perceptions on the chalk and talk method of teaching was found to be reasonably good (Cronbach's Alpha 0.85), and that for PPT was excellent (Cronbach's Alpha 0.9).

Statistical analyses to determine whether there were any significant differences between responses towards a particular perception about the two methods was done using the z test for two proportions and were performed using Microsoft Excel (Microsoft Corporation, Redmond, WA) and the Statistical Package for the Social Studies (SPSS) version 22 (IBM Corp., Armonk, New York). A p-value <0.05 was considered to be significant.

Participants' individual identities were not revealed throughout the study, so approval was not required from the institutional ethics committee. However, ethical approval was sought from Assam Medical College and Hospital's ethics committee, Dibrugarh, Assam, which was approved vide Ref: AMC/EC/4299. Nonetheless, all students provided informed consent prior to the collection of the data.

Results

The age of the participants ranged from 22 to 23 years. Out of the 100 study participants, 57 were male, and 43 were females.

The distributions of "strongly agree" responses with respect to various perceptions are shown in Figure 1. A relatively higher proportion of the students (30%) strongly agreed that they understood the lecture content better when it was delivered via PPT. However, more students agreed that the CNT method was better than the PPT method with regard to student-teacher interaction (33% vs 29%).

A more significant proportion of the students (38%) strongly agreed that the CNT method was more conducive to concentration and content retention than PPT (30%). There was also strong agreement that the CNT method fostered interest (26%) and was sufficiently audible (28%). Notably, however, compared to the CNT method, more students thought that PPT was superior with respect to the content organization (35% vs 30%), professionalism (27% vs 25%), and preparation (31% vs 30%).

The distributions of "agree" responses with respect to various perceptions are shown in Figure 2. The majority favored CNT over PPT with respect to better understanding the lecture (71% vs 56%) and better interaction with the teacher (53% vs 45%). CNT was also rated better than PPT with regard to concentration and content retention (50% vs 46%), as well perceptions of teacher professionalism (59% vs 52%) and preparation. To the suggestion that PPT was associated with a lack of eye contact between the teacher and students, 47% responded with "agree", compared to 41% for CNT. PPT attracted more "agree" responses than CNT with respect to being an attractive (58% vs 51%) and informative (71% vs 68%) teaching modality.

The distributions of "disagree" responses with respect to various perceptions are shown in Figure 3. Among the 100 study participants, 12% disagreed that PPT was a better teaching model for students' understanding, and 24% disagreed that teacher-student interaction is better in PPT. More respondents disagreed with the suggestions that PPT advances understanding of lecture content (16% vs 12%), facilitates better concentration and content retention (21% vs 10%), is audible (12% vs 17%), that the teacher is more professional (20% vs 15%), and that the PPT lecture would take the teacher a lot longer than preparing a CNT lecture (23% vs 18%). Notably, however, 20% of the respondents

Figure 1 Pattern of "strongly agree" responses to various survey prompts (PPT-PowerPoint).

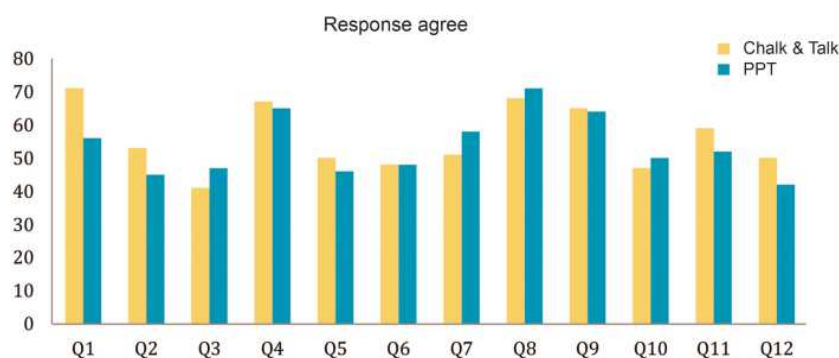

Figure 2 Pattern of “agree” responses to various survey prompts (PPT-PowerPoint).

Figure 3 Pattern of “disagree” responses to various survey prompts (PPT-PowerPoint).

disagreed that the CNT method is well organized. Small numbers of respondents strongly disagreed that there was a lack of eye contact between teacher and student associated with CNT (9%) and PPT (5%) and that the quality and quantity of the lecture notes could not be maintained with respect to CNT (10%) and PPT (3%), as shown in Figure 4.

In our present study, the study participants’ responses on the 12 statements regarding their perceptions were collected separately for each of the teaching methods in two different questionnaires implying a total of 200 questionnaires and thus with a possibility of agreeing or

disagreeing with any of the perceptions for one or both the methods. We have used the z test for two proportions to test whether there are any significant differences in proportions of responses towards the perceptions under study between the two teaching methods.

The total number of study participants who agreed with a particular perception was assessed by summing up the number of responses “strongly agree” and “agree” for that specific perception. Similarly, the number of responses “disagree” and “strongly disagree” for a particular perception was summed up to evaluate the total number of

Figure 4 Pattern of “strongly disagree” responses to various survey points (PPT-PowerPoint).

disagreements for that perception. The proportion of respondents that favored CNT (97%) as a method that facilitated better understanding was significantly higher than the proportion that favored PPT (86%). Eighty-six percent of the respondents agreed that CNT fostered better student-teacher interaction than PPT ($p < 0.05$), and 88% agreed that CNT helped them to concentrate and remember the course content better ($p < 0.05$). There were no significant differences in respondents' proportions in broad agreement with other perceptions evaluated in the study (Table 2).

Discussion

The current study investigated student perceptions in an effort to identify the lecture delivery techniques they favored in the classroom. There was a strong agreement that the CNT method is a better technique than PPT with respect to promoting concentration and content retention. This is concordant with a previously reported review.¹⁹ The CNT method of teaching allows the students to note the teacher's talk comfortably, but doing the same with a PPT lecture is not as easy due to the comparative rapidity of delivery.

PPT lectures were deemed more attractive, informative, and well organized by the students in the current study. This may be due to the absence of three-dimensional figures, animated videos, and real-time sounds associated with the CNT method. The inclusion of such features in PPT presentations can help enhance student satisfaction.

In the present study, the respondents significantly preferred lecture delivery in CNT as a clear and understandable method. Also, to concentrate and remember the content, higher

proportions of respondents agreed on CNT as a helpful technique compared to PPT. The CNT method remained a dominant form of lecture delivery and was preferred by the students in a review reported in 2010,²⁰ consistent with the current findings. However, the students felt that the lecture contents were more informative when delivered via PPT compared to the CNT method. PPT slides facilitate lecture delivery with numbers, figures or new concepts via visual aids, which helps in providing more information in less time.⁸

No significant differences in reported perceptions of CNT and PPT methods were evident in the current study with respect to teacher-student eye contact, advancing student understanding, maintaining the quality and quantity of lecture notes, generating interest, informative content, audibility or professionalism of the teacher. These findings are consistent with some other studies.^{21,22} In another study, most participants, advocated a combined method²³ of teaching, which is concordant with the current study results as in the present study, none between two teaching methods were opined to be the single best method of lecture delivery.

In the present study, student ratings of the teacher's professional responses did not differ significantly between the two methods. Although the development of modern technology has provided various up to date and advanced ways of displaying and delivering lectures in the classroom, however, the essential aspect of any teaching method is the teacher himself. The teacher must be knowledgeable and has to be well versed with the topic to make students understand and develop interest. The importance of the teacher's quality, irrespective of the methods they used in the classroom were

Table 2 Difference in Proportions of the Agreement for Various Perceptions Towards the Teaching Methods Understudy

Question No.	Proportions of Agreement		Chi-Square (p-value)	Proportions of Disagreement	
	Chalk and Talk (CNT)	PowerPoint (PPT)		Chalk and Talk (CNT)	PowerPoint (PPT)
Q1	97	86	7.74(0.005)**	3	14
Q2	86	74	4.47(0.03)*	14	26
Q3	55	61	0.73(0.39)	45	39
Q4	87	84	0.36(0.54)	13	16
Q5	88	76	4.85(0.03)*	12	24
Q6	60	60	-	40	40
Q7	77	78	0.03(0.86)	23	22
Q8	87	91	0.81(0.37)	13	9
Q9	93	88	1.45(0.23)	7	12
Q10	77	85	2.07(0.15)	23	15
Q11	84	79	0.82(0.36)	16	21
Q12	80	73	1.36(0.24)	20	27

Notes: *p-value is significant, **p-value is highly significant.

emphasized by Ahmed C in his research report almost two decades ago, which is relevant in present times also.²⁴ In another study comparing electronic presentations versus CNT, the authors advocated that the quality of the teacher is more vital than the teaching method he adopts as a good quality teacher knows how to impart essential information that students find accessible, which can prepare them to understand newer and more challenging things irrespective of the teaching method used.²⁵

Limitations

The present study was conducted in only one medical institution, including the 4th-semester undergraduate MBBS students. It limits the study results to come to an overall conclusion about the medical students' perception of the teaching methods. Inclusion of more similar institutions and students of postgraduate or other undergraduate MBBS programs may enable the researchers to have a more generalized conclusion about the teaching methods' perceptions and limitations.

Conclusion

The study highlights a preference for a combined teaching method that includes both CNT and PPT. However, most of the present study participants emphasized the importance of CNT, acknowledged it as an effective and convenient teaching modality, and recommended it for teaching. The study clearly indicates the benefits of the conventional CNT method with regard to better understanding and learning the concepts presented.

Ethics Considerations

All data were treated confidentially, and the study was conducted in accordance with the Declaration of Helsinki.

Acknowledgments

Thanks to the student participants who have participated in this study and have given their valued responses. All departmental colleagues who helped us access the departmental library and settings during the study were also acknowledged.

Author Contributions

All authors made a significant contribution to the work reported, whether that is in the conception, study design, execution, acquisition of data, analysis and interpretation, or in all these areas; took part in drafting, revising or critically reviewing the article; gave final approval of the version to be published; have agreed on the journal to

which the article has been submitted; and agree to be accountable for all aspects of the work.

Advances in Medical Education and Practice is an international, peer-reviewed, open access journal that aims to present and publish research on Medical Education covering medical, dental, nursing and allied health care professional education. The journal covers undergraduate education, postgraduate training and continuing medical education

including emerging trends and innovative models linking education, research, and health care services. The manuscript management system is completely online and includes a very quick and fair peer-review system. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.
