Macroporous Nanofibrous Vascular Scaffold with Improved Biodegradability and Smooth Muscle Cells Infiltration Prepared by Dual Phase Separation Technique [Corrigendum]

The authors have advised the representative image of the migratory HVSMCs for the TCP (Figure 13A) and PLLA/PLGA/PCL scaffold (Figure 13B) on Page 7017 were overlapped. Following a review of the original images, the authors found different sets of images were mixed when processing the data which resulted in the incorrect image to be used for PLLA/PLGA/PCL (Figure 13B).

The correct Figure 13 is shown below.

![Figure 13](image-url)

Figure 13 (A–D) The representative image of the migratory HVSMCs located on the lower site of Transwell membrane for the TCP, PLLA/PLGA/PCL, PLLA/PLGA/PCL-Heparin, and PLLA/PLGA/PCL-PDGF-BB scaffolds, respectively. (E) The quantification of HVSMCs migration.

Notes: *P<0.05, **P<0.01.

Abbreviations: HVSMCs, human vascular smooth muscle cells; PCL, poly(ε-caprolactone); PDGF-BB, platelet-derived growth factor-BB; PLGA, poly(lactic-co-glycolic acid); PLLA, poly(L-lactic acid); TCP, tissue culture plate.

The authors apologize for this error and advise it does not affect the results and conclusions of the paper.
